

# TMP390 超小型、双通道、0.5μA、电阻器可编程温度开关

## 1 特性

- 电阻器可编程的温度跳闸点和迟滞选项
  - 电阻器容差可实现零误差
  - 迟滞选项：5°C 和 10°C
- 适用于过热或欠温检测的独立输出
  - 通道 A（过热）：+30 至 +124°C，步进为 2°C
  - 通道 B（欠温）：-50 至 +25°C，步进为 5°C
- 精度级别选项（在 -55°C 至 +130°C 范围内达到最大值）：
  - A2 级：±3.0°C（在 0°C 至 +70°C 范围内为 ±1.5°C）
  - A3 级：±3.5°C（在 0°C 至 +70°C 范围内为 ±2.0°C）
- 超低功耗：25°C 时为 0.5μA（典型值）
- 工作温度范围：-55°C 至 +130°C
- 电源电压：1.62 至 5.5V
- 开漏输出
- 跳闸测试功能支持系统内测试
- 采用 SOT-563 (1.60mm × 1.20mm)、6 引脚封装

## 2 应用

- 直流/交流逆变器
- 直流/直流转换器
- 温度变送器
- 环境控制系统 (ECS)
- 电动工具
- 移动电源
- 无线基础设施
  - WLAN/Wi-Fi 接入点
  - 核心路由器
  - 边缘路由器
  - 宏远程无线电单元 (RRU)

## 3 说明

TMP390 器件属于超低功耗、双通道、电阻器可编程温度开关系列，支持对 -50°C 至 130°C 范围内的系统过热事件进行保护和检测。TMP390 可提供独立的过热（热）和欠温（冷）检测。跳闸温度 ( $T_{TRIP}$ ) 和热迟滞 ( $T_{HYST}$ ) 选项可由两个位于 SETA 和 SETB 引脚上的 E96 系列 (1%) 十倍标准值电阻器进行编程。每个电阻器的取值范围为 1.05KΩ 至 909KΩ，可从 48 个唯一值中择一。

SETA 输入的接地电阻器值可设置通道 A 的  $T_{TRIP}$  阈值。SETB 输入的接地电阻器值可设置通道 B 的  $T_{TRIP}$  阈值并将  $T_{HYST}$  选项设置为 5°C，或将两个通道上的选项设置为 10°C，以防止发生不必要的数字输出开关行为。电阻器精度对  $T_{TRIP}$  精度没有影响。

为使客户能够进行电路板级制造，TMP390 可通过发挥 SETA 或 SETB 引脚功能激活数字输出，从而支持跳闸测试功能。

### 器件信息<sup>(1)</sup>

| 器件型号    | 封装          | 封装尺寸（标称值）       |
|---------|-------------|-----------------|
| TMP390、 | SOT-563 (6) | 1.60mm × 1.20mm |

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

### 器件比较

| 器件编号   | 功能  | 输出类型 |
|--------|-----|------|
| TMP390 | 热/冷 | 开漏   |

## 5 Pin Configuration and Functions

### Pin Functions

| PIN |                          | I/O          | DESCRIPTION                                                                                                   |
|-----|--------------------------|--------------|---------------------------------------------------------------------------------------------------------------|
| NO. | NAME                     |              |                                                                                                               |
| 1   | SETA                     | Input        | Channel A temperature set point. Connect a standard E96, 1% resistance between SETA and GND.                  |
| 2   | SETB                     | Input        | Channel B temperature and Hysteresis set point. Connect a standard E96, 1% resistance between SETB and GND.   |
| 3   | GND                      | Ground       | Device ground.                                                                                                |
| 4   | $\overline{\text{OUTB}}$ | Logic Output | Channel B logic open-drain active low output. If unused, the output can be left floating or connected to GND. |
| 5   | VDD                      | Supply       | Power supply voltage (1.62 V – 5.5 V).                                                                        |
| 6   | $\overline{\text{OUTA}}$ | Logic Output | Channel A logic open-drain active low output. If unused, the output can be left floating or connected to GND. |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

|                                                |                                                     | MIN  | MAX       | UNIT |
|------------------------------------------------|-----------------------------------------------------|------|-----------|------|
| Supply voltage                                 | VDD                                                 | −0.3 | 6         | V    |
| Voltage at                                     | $\overline{\text{OUTA}}$ , $\overline{\text{OUTB}}$ | −0.3 | 6         | V    |
| Voltage at                                     | SETA, SETB                                          | −0.3 | VDD + 0.3 | V    |
| Operating junction temperature, T <sub>J</sub> |                                                     | −55  | 155       | °C   |
| Storage temperature, T <sub>stg</sub>          |                                                     | −60  | 155       | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Powering the device when the operating junction temperature is outside the *Recommended Operating Conditions*, may affect the functional operation of the device. The device must be power cycled after the system has returned to conditions as indicated under *Recommended Operating Conditions*.

### 6.2 ESD Ratings

|                    |                         |                                                                                | VALUE | UNIT |
|--------------------|-------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                    |                         | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

|                   |                                                                                 | MIN  | NOM | MAX       | UNIT |
|-------------------|---------------------------------------------------------------------------------|------|-----|-----------|------|
| VDD               | Supply voltage                                                                  | 1.62 | 3.3 | 5.5       | V    |
| V <sub>OUTA</sub> | Channel A output pull-up voltage (open-drain)                                   |      |     | VDD + 0.3 | V    |
| V <sub>OUTB</sub> | Channel B output pull-up voltage (open-drain)                                   |      |     | VDD + 0.3 | V    |
| I <sub>SETA</sub> | SETA pin circuit leakage current                                                | −20  |     | 20        | nA   |
| I <sub>SETB</sub> | SETB pin circuit leakage current                                                | −20  |     | 20        | nA   |
| R <sub>PA</sub>   | Pullup resistor connected from $\overline{\text{OUTA}}$ to VDDIO <sup>(1)</sup> | 1    | 10  |           | kΩ   |
| R <sub>PB</sub>   | Pullup resistor connected from $\overline{\text{OUTB}}$ to VDDIO <sup>(1)</sup> |      |     |           |      |
| T <sub>A</sub>    | Operating free-air temperature (specified performance)                          | −55  |     | 130       | °C   |
|                   | Operating free-air temperature (functional, unspecified performance)            | −55  |     | 150       | °C   |

- (1) Where VDDIO is an independent power supply other than VDD, and shall not exceed (VDD + 0.3) V.

### 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | TMP390    | UNIT |
|-------------------------------|----------------------------------------------|-----------|------|
|                               |                                              | DRL (SOT) |      |
|                               |                                              | 6 PINS    |      |

| R <sub>θJC(top)</sub>         | Junction-to-case (top) thermal resistance    | 105       | °C/W |
| R <sub>θJB</sub>              | Junction-to-board thermal resistance         | 87.5      | °C/W |
| ψ <sub>JT</sub>               | Junction-to-top characterization parameter   | 6.1       | °C/W |
| ψ <sub>JB</sub>               | Junction-to-board characterization parameter | 87        | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor IC Package Thermal Metrics](#) application report, (SPRA953).

## 6.5 Electrical Characteristics

Minimum and maximum specifications are over -55°C to 130°C and VDD = 1.62V - 5.5V (unless otherwise noted); typical specifications are at T<sub>A</sub> = 25°C and VDD = 3.3 V.

| PARAMETER                        |                                                  | TEST CONDITIONS           |                                     | MIN  | TYP  | MAX | UNIT   |

## 7 Detailed Description

### 7.1 Overview

The TMP390 ultra-low power, dual channel, resistor programmable temperature switches enable detection and protection of system thermal events over a wide temperature range. The TMP390 offers independent overtemperature (hot) and undertemperature (cold) detection. The trip temperatures and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The TMP390 can enable a customer board-level manufacturing test through the trip test function that can force the SETA or SETB pins to logic high to activates the digital outputs.

### 7.2 Functional Block Diagram

图 6. Simplified Schematic

### 7.3 Feature Description

The TMP390 requires two resistors to set the two trip points and hysteresis, according to 表 1 and 表 2, for the hot and cold channel device. The output of the TMP390 is open-drain and requires two pullup resistors. TI recommends to use a pullup voltage supply that does not exceed  $V_{DD} + 0.3\text{ V}$ . The pullup resistors used in between the  $\overline{\text{OUTA}}$  and  $\overline{\text{OUTB}}$  pins and the pullup supply should be greater than  $1\text{ k}\Omega$ . The device powers on when the supply voltage goes beyond  $1.5\text{ V}$ , and starts sampling the input resistors to set the two trip points and hysteresis value after power-on. These values will remain the same until the device goes through a power cycle. After the device sets the trip points and hysteresis level, the device will update the output every half a second. The conversion time is typically  $0.65\text{ ms}$  when the temperature is checked against the trip points and the outputs are updated. The device remains in standby mode between conversions. If either channel is not used, the output can be grounded or left floating.

#### 7.3.1 TMP390 Programming Tables

The temperature threshold and hysteresis options for the TMP390 device are programmed using two external 1% E96 standard resistors. The specific resistor value to ground on the SETA input sets the temperature threshold of channel A. The specific resistor value to ground on the SETB input sets the temperature threshold of channel B, as well as the hysteresis for both channel A and channel B.

### 7.3.2 Trip Test

The purpose of the trip test is in system manufacturing test without putting the TMP390 through costly temperature verification of the assembly of TMP390 and pullup resistors. When the SETA or SETB pin is set to a high logic level, the associated output goes low. When the input pin level goes low, the output goes to its previous condition before the trip test. The trip test does not affect the current condition of the device. The trip test signals should stay above  $0.8 \times VDD$  for logic high and below  $0.2 \times VDD$  for logic low.

The trip test operation is shown in 图 7. The trip test must be performed with a single toggle when the device is operating at a temperature that will not cause the corresponding output to trip. The trip test is intended for production testing after assembly, and must not be used as a functional feature.

图 7. TMP390 Trip Test Operation

## 7.4 Device Functional Modes

The device has one mode of operation that applies when operated within the [Recommended Operating Conditions](#). The temperature threshold for OUTA and OUTB pins is configured by the resistors on the SETA and SETB pins. The hysteresis is configured by the value of the resistor on the SETB pin.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Applications Information

The TMP390 device is part of a family of ultra-low power, dual channel, resistor programmable temperature switches that can enable detection and protection of system thermal events over a wide temperature range. The trip temperatures ( $T_{TRIP}$ ) and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The thermal hysteresis ( $T_{HYST}$ ) options of 5°C or 10°C are resistor-programmed to prevent undesired digital output switching.

### 8.2 Typical Applications

#### 8.2.1 Simplified Application Schematic

Figure 8 shows the simplified schematic where  $R_{SETA}$  and  $R_{SETB}$  are used to set channel A trip point (SETA) and channel B trip point and hysteresis for both channels (SETB). SETA and SETB can be programmed at a variety of temperatures based on the device, as described in [Table 1](#) for channel A trip point, and [Table 2](#) for channel B trip point and hysteresis for both channels. OUTA and OUTB outputs correspond to the temperature threshold detection at SETA and SETB, respectively.

**Figure 8. Simplified Schematic**

##### 8.2.1.1 Design Requirements

The TMP390 requires two resistors to set the high and low trip points and hysteresis, and two pullup resistors for the open-drain device. TI also highly recommended to place a 0.1-μF, power-supply bypassing capacitor close to the VDD supply pin. To minimize the internal power dissipation, use two pullup resistors greater than 1 kΩ from the OUTA and OUTB pins to the VDD pin. A separate supply, VDDIO, may be used for the pullup voltage to set the output voltage level to the level required by the MCU, as shown in [Figure 8](#). The open-drain output gives flexibility of pulling up to any voltage independent of VDD (VDDIO must be less than or equal to VDD + 0.3 V). This allows for use of longer cables or different power supply options. If a separate voltage level is not required, TI recommends to tie the pullup to the TMP390 VDD.

If the SETA or SETB connected resistor value is outside the legal range, the associated output goes to permanent output zero stage and the channel cannot be used. The other channel still will be in operating condition, and device can be used in one channel mode. If the SETB input is grounded or left floating, the Channel B cannot be used and the hysteresis for Channel A cannot be guaranteed. The SETA and SETB connected resistors are measured during POR. If two consecutive measurements are not matching each other, then the device sets the associated channel output to zero and repeats the resistor measurements until the measurements match. When the measurements match, the channel output is released. Note that it is possible to connect some device outputs together by shorting the OUTA or OUTB line.

## Typical Applications (continued)

### 8.2.1.2 Detailed Design Procedure

The resistor to ground values on the SETA input sets the  $T_{TRIP}$  threshold of Channel A. The resistor to ground value on the SETB input sets the  $T_{TRIP}$  threshold of Channel B—as well as the  $T_{HYST}$  5°C, and 10°C options—to prevent undesired digital output switching. TI recommends that the resistors at SETA and SETB have a 1% tolerance from the E-96 series of resistance values to comply with the programmed trip settings of the TMP390. Each resistor can range from 1.05 K $\Omega$  to 909 K $\Omega$ , representing one of 48 unique values. The exact temperature thresholds and trip points are shown in 表 1, 表 2, and . The pullup resistors should be at least 1 k $\Omega$  to minimize internal power dissipation. To get the correct threshold for resistor values, take care to minimize the board level capacitance and leakage at SETA and SETB pins.

The waveform for the TMP390 output under the hot/cold thresholds is shown in Figure 9. The hysteresis can be set to either 5°C, or 10°C. When the temperature exceeds the hot trip point threshold, OUTA goes low until the temperature drops below the hysteresis threshold. When the temperature drops below the cold trip threshold, OUTB goes low and returns high after the temperature rises above the hysteresis threshold. If the switch has already tripped and the temperature is in the hysteresis band, a POR event will cause the output to go high after the power is restored.

### 8.2.1.3 Application Curves

Figure 9. TMP390 Output With Hot/Cold Thresholds With Hysteresis

### 8.2.2 TMP390 With 10°C Hysteresis

Figure 10 shows an example circuit for overtemperature and undertemperature protection using the TMP390. In this example, the trip points are set at –25°C and +90°C with 10°C hysteresis.

## Typical Applications (continued)

**Figure 10. TMP390 Example Circuit at +90°C and -25°C Thresholds With 10°C Hysteresis**

### 8.2.2.1 Design Requirements

In this example, VDD can be  $\geq 3$  V. The output pins may be tied to a switch to control a fan or other analog circuitry. Figure 10 uses 10-k $\Omega$  pullup resistors at the  $\overline{\text{OUTA}}$  and  $\overline{\text{OUTB}}$  outputs. Place a 0.1- $\mu\text{F}$  bypass capacitor close to the TMP390 device to reduce noise coupled from the power supply. If needed, the output of multiple parts can be connected together.

### 8.2.2.2 Detailed Design Procedure

SETA sets the +90°C threshold using 78.7 k $\Omega$ . SETB sets the -25°C trip point and 10°C hysteresis using 215 k $\Omega$ . These values were determined using Table 1 and Table 2. These resistors should have maximum of 1% tolerance and 100 ppm/°C or less over the desired temperature range. A summary of the resistor settings used in this example is shown in Table 3. See Table 1 and Table 2 for additional trip points and hysteresis configurations.

The switching output of the TMP390 can be visualized with the output diagram shown in Figure 11. It is key to notice that hysteresis is subtracted from the Channel A threshold and added to the Channel B threshold values.  $\overline{\text{OUTA}}$  remains high until the sensor reaches +90°C where the output goes low, and returns high after the temperature drops back down to +80°C.  $\overline{\text{OUTB}}$  trips when the temperature stays below -25°C and goes low until the temperature rises above -15°C.

**Table 3. Example Resistor Settings and Trip Points**

| CHANNEL | RESISTOR SETTING (k $\Omega$ ) | HYSTERESIS (°C) | TRIP TEMPERATURE (°C) |
|---------|--------------------------------|-----------------|-----------------------|
| SETA    | 78.7                           | 10              | +90                   |
| SETB    | 215                            |                 | -25                   |

### 8.2.3.1 Application Curve

**Figure 13. TMP390 One Channel (Hot) Operation Thresholds and Hysteresis**

## 8.2.4 One Channel Operation for Cold Trip Point

Figure 14 shows the TMP390 configured for one channel operation, with a single resistor to set the cold trip point and hysteresis. The resistor values for one channel cold trip point is same as described in 表 2.

Figure 14. TMP390 One Channel (Cold) Operation Example Circuit With  $-20^{\circ}\text{C}$  Trip Point and  $10^{\circ}\text{C}$  Hysteresis

### 8.2.4.1 Application Curve

Figure 15. TMP390 One Channel (Cold) Operation Thresholds and Hysteresis

## 9 Power Supply Recommendations

The low supply current and wide supply range of the TMP390 allow the device to be powered from many sources. VDDIO must always be lower than or equal to VDD + 0.3 V.

Power supply bypassing is strongly recommended by adding a 0.1-μF capacitor from VDD to GND. In noisy environments, TI recommends to add a filter with 0.1-μF capacitor and 100-Ω resistor between external supply and VDD to limit the power supply noise.

## 10 Layout

### 10.1 Layout Guidelines

The TMP390 is extremely simple to layout. Place the power supply bypass capacitor as close to the device as possible, and connect the capacitor as shown in [Figure 16](#). Place the R<sub>SETA</sub> and R<sub>SETB</sub> resistors as close to the device as possible. Carefully consider the resistor placement to avoid additional leakage or parasitic capacitance, as this may affect the actual sense value for the trip thresholds and hysteresis.

### 10.2 Layout Example

Figure 16. TMP390 Recommended Layout

## 11 器件和文档支持

### 11.1 接收文档更新通知

要接收文档更新通知，请导航至 [TI.com.cn](http://TI.com.cn) 上的器件产品文件夹。单击右上角的 [通知我](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 11.2 社区资源

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 11.3 商标

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TMP390 :**

- Automotive : [TMP390-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

4223266/B 12/2020

## NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
