

用于电源门控的毫微级功耗系统计时器 TPL5110-Q1 AEC-Q100

1 特性

- 符合汽车应用 要求
- 具有符合 AEC-Q100 的下列结果：
 - 器件温度 1 级：-40°C 至 125°C 的环境运行温度范围
 - 器件人体放电模式 (HBM) 静电放电 (ESD) 分类等级 2
 - 器件组件充电模式 (CDM) ESD 分类等级 C5
- 电压为 2.5V 时，电流消耗为 35nA (典型值)
- 电源电压范围：1.8V 至 5.5V
- 可选时间间隔范围：100ms 至 7200s
- 定时器精度：1% (典型值)
- 可通过电阻选择时间间隔
- 手动为 MOSFET 上电
- 单次触发功能
- TPL5x10Q 系列符合 AEC-Q100 标准的毫微功耗系统定时器：
 - TPL5010-Q1**：延迟范围可通过编程设定的看门狗功能
 - TPL5110-Q1**：延迟范围可通过编程设定且具有单次触发功能的金属氧化物半导体 (MOS) 驱动器

2 应用

- 电动汽车
- 电池供电系统
- 离合器执行器电路
- 车门把手电路
- 智能钥匙
- 远端电流传感器
- 出入检测

3 说明

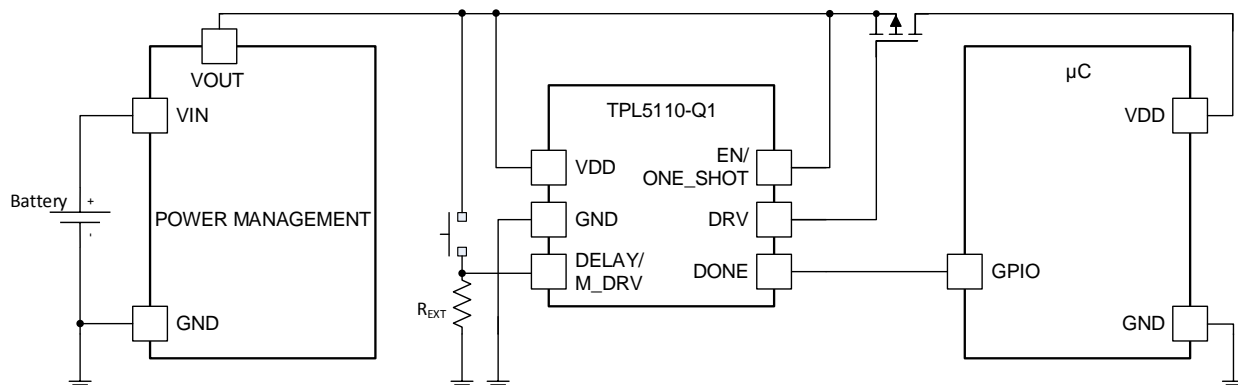

TPL5110-Q1 毫微级计时器是一种集成了 MOSFET 驱动器且通过 AEC-Q100 认证的低功耗计时器，非常适合占空比或电池供电型应用中的电源门控。TPL5110-Q1 的电流消耗仅为 35nA，可用于支持电源线路，并大幅降低系统睡眠期间的总待机电流。这一节能特性可以明显缩小电池尺寸，因此 TPL5111 非常适合能量采集或无线传感器应用的输出电流传感电阻器和运算放大器而得以实现。TPL5110-Q1 可提供 100ms 至 7200s 的可选计时间隔，适用于电源门控应用。此外，TPL5110-Q1 还具有独特的单次触发功能，计时器可仅在一个周期内为 MOSFET 供电。TPL5110-Q1 采用 6 引脚 SOT23 封装。

6 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION	APPLICATION INFORMATION
NO.	NAME			
1	VDD	P	Supply voltage	
2	GND	G	Ground	
3	DELAY/ M_DRV	I	Time interval set and manual MOSFET Power ON	Resistance between this pin and GND is used to select the time interval. The manual MOSFET power ON switch is also connected to this pin.
4	DONE	I	Logic Input for watchdog functionality	Digital signal driven by the μ C to indicate successful processing.
5	DRV	O	Power Gating output signal generated every t_{IP}	The Gate of the MOSFET is connected to this pin. When DRV = LOW, the MOSFET is ON.
6	EN/ ONE_SHOT	I	Selector of mode of operation	When EN/ONE_SHOT = HIGH, the TPL5110-Q1 works as a TIMER. When EN/ONE_SHOT = LOW, the TPL5110-Q1 turns on the MOSFET one time for the programmed time interval. The next power on of the MOSFET is enabled by the manual power ON.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

	MIN	MAX	UNIT
Supply voltage (VDD-GND)	-0.3	6.0	V
Input voltage at any pin ⁽³⁾	-0.3	VDD + 0.3	V
Input Current on any pin	-5	+5	mA
Storage temperature, T _{stg}	-65	150	°C
Junction temperature, T _J ⁽⁴⁾		150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2)

(3) The voltage between any two pins should not exceed 6V.

(4) The maximum power dissipation is a function of T_J(MAX), θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation at any ambient temperature is P_DMAX = (T_J(MAX) - T_A) / θ_{JA}. All numbers apply for packages soldered directly onto a PC board.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human Body Model, per AEC Q100-002 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with ANSI/ESDA/JADEC JS-001 specification.

7.3 Recommended Operating Ratings

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply Voltage (VDD-GND)	1.8	5.5	V
Temperature Range	-40	125	°C

7.4 Thermal Information

V _{IH_M_DRV}	Minimum Logic High Threshold DELAY/M_DRV pin ⁽⁵⁾			1.5		V

- (1) Electrical Characteristics Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No specification of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) Limits are specified by testing, design, or statistical analysis at 25°C. Limits over the operating temperature range are specified through correlations using statistical quality control (SQC) method.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not specified on shipped production material.
- (4) The supply current excludes load and pull-up resistor current. Input pins are at GND or VDD.
- (5) This parameter is specified by design and/or characterization and is not tested in production.
- (6) The accuracy for time interval settings below 1second is $\pm 100\text{ms}$.
- (7) Operational life time test procedure equivalent to 10 years.

7.6 Timing Requirements

			MIN ⁽¹⁾	NOM ⁽²⁾	MAX ⁽¹⁾	UNIT
$t_{r_{DRV}}$	Rise Time DRV ⁽³⁾	Capacitive load 50 pF		50		ns
$t_{f_{DRV}}$	Fall Time DRV ⁽³⁾	Capacitive load 50 pF		50		ns
$t_{D_{DONE}}$	DONE to DRV delay	Min delay ⁽⁴⁾		100		ns
		Max delay ⁽⁴⁾		t_{DRV}		
$t_{M_{DRV}}$	Minimum Valid manual MOSFET Power ON	Observation time 30ms		20		ms
t_{DB}	De-bounce manual MOSFET Power ON			20		ms

- (1) Limits are specified by testing, design, or statistical analysis at 25°C. Limits over the operating temperature range are specified through correlations using statistical quality control (SQC) method.
- (2) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not specified on shipped production material.
- (3) This parameter is specified by design and/or characterization and is not tested in production.

8 Detailed Description

8.1 Overview

The TPL5110-Q1 is a timer with power gating feature. It is ideal for use in power-cycled applications and provides selectable timing from 100ms to 7200s.

Once configured in timer mode (EN/ONE_SHOT= HIGH) the TPL5110-Q1 periodically sends out a DRV signal to a MOSFET to turn on the μC . If the μC replies with a DONE signal within the programmed time interval (t_{DRV}) the TPL5110-Q1 turns off the μC , otherwise the TPL5110-Q1 keeps the μC in the on state for a time equal to t_{DRV} .

The TPL5110-Q1 can work also in a one shot mode (EN/ONE_SHOT= LOW). In this mode the DRV signal is sent out just one time at the power on of the TPL5110-Q1 to turn on the μC . If the μC replies with a DONE signal within the programmed time interval (t_{DRV}) the TPL5110-Q1 turns off the μC , otherwise the TPL5110-Q1 keeps the μC in the on state for a time equal to t_{DRV} .

8.2 Functional Block Diagram

8.3 Feature Description

The TPL5110-Q1 implements a periodical power gating feature or one shot power gating according to the EN/ONE_SHOT voltage. A manual MOSFET Power ON function is realized by momentarily pulling the DELAY/M_DRV pin to VDD.

8.3.1 DRV

The gate of the MOSFET is connected to the DRV pin. When DRV= LOW, the MOSFET is turned ON. The pulse generated at DRV is equal to the selected time interval period, minus 50ms. It is shorter in the case of a DONE signal received from the μC . If the DONE signal is not received within the programmed time interval (minus 50ms), the DRV signal will be high for the last 50ms of the time interval in order to turn off the MOSFET before the next cycle starts.

The default value (after resistance reading) is HIGH. The signal is sent out from the TPL5110-Q1 when the programmed time interval starts. When the DRV is LOW, the manual power ON signal is ignored.

8.3.2 DONE

The DONE pin is driven by a μC to signal that the μC is working properly. The TPL5110-Q1 recognizes a valid DONE signal as a low to high transition; if two or more DONE signals are received within the time interval, only the first DONE signal is processed. The minimum DONE signal pulse length is 100ns. When the TPL5110-Q1 receives the DONE signal it asserts DRV logic HIGH.

8.4 Device Functional Modes

8.4.1 Startup

During startup, after POR, the TPL5110-Q1 executes a one-time measurement of the resistance attached to the DELAY/M_DRV pin in order to determine the desired time interval for DRV. This measurement interval is t_{R_EXT} . During this measurement a constant current is temporarily flowing into R_{EXT} .

Once the reading of the external resistance is completed the TPL5110-Q1 enters automatically in one of the 2 modes according to the EN/ONE_SHOT value. The EN/ONE_SHOT pin needs to be hard wired to GND or VDD according to the required mode of operation.

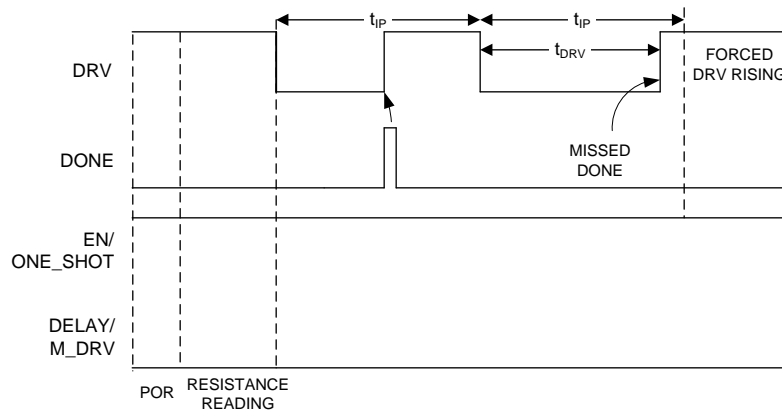

Figure 8. Startup - Timer mode

8.4.2 Timer Mode

During timer mode (EN/ONE_SHOT = HIGH), the TPL5110-Q1 asserts periodic DRV pulses according to the programmed time interval. The length of the DRV pulses is set by the receiving of a DONE pulse from the uC. See [Figure 8](#).

8.4.3 One Shot Mode

During One shot mode (EN/ONE_SHOT = LOW), the TPL5110-Q1 generates just one pulse at the DRV pin which lasts according to the programmed time interval. In one-shot mode, other DRV pulses can be triggered using the DELAY/M_DRV pin. If a valid manual power ON occurs when EN/ONE_SHOT is LOW, the TPL5110-Q1 generates just one pulse at the DRV pin. The duration of the pulse is set by the programmed time interval. Also in this case, if a DONE signal is received within the programmed time interval (minus 50ms), the MOSFET connected to the DRV pin is turned off. See [Figure 9](#) and [Figure 10](#).

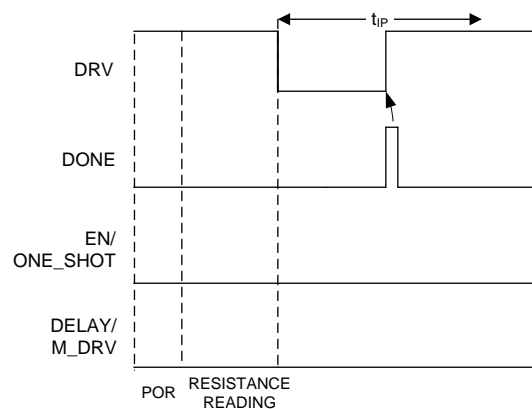

Figure 9. Startup One Shot Mode, (DONE Received Within t_{IP})

Device Functional Modes (continued)

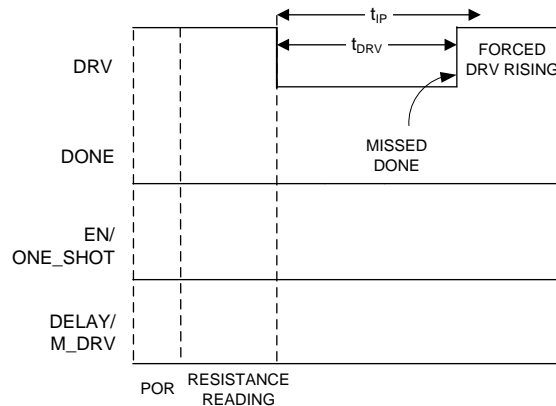

Figure 10. Startup One Shot Mode, (No DONE Received Within t_{IP})

8.5 Programming

8.5.1 Configuring the Time Interval with the DELAY/M_DRV Pin

The time interval between 2 adjacent DRV pulses (falling edges, in timer mode) is selectable through an external resistance (R_{EXT}) between the DELAY/M_DRV pin and ground. The resistance (R_{EXT}) must be in the range between 500Ω and $170k\Omega$. At least a 1% precision resistance is recommended. See section [Selection of the External Resistance](#) on how to set the time interval using R_{EXT} .

8.5.2 Manual MOSFET Power ON Applied to the DELAY/M_DRV Pin

If VDD is connected to the DELAY/M_DRV pin, the TPL5110-Q1 recognizes this as a manual MOSFET Power ON condition. In this case the time interval is not set. If the manual MOSFET Power ON is asserted during the POR or during the reading procedure, the reading procedure is aborted and is re-started as soon as the manual MOSFET Power ON switch is released. A pulse on the DELAY/M_DRV pin is recognized as a valid manual MOSFET Power ON only if it lasts at least 20ms (observation time is 30ms). The manual MOSFET Power ON may be implemented using a switch (momentary mechanical action).

If the DRV is already LOW (MOSFET ON) the manual MOSFET Power ON is ignored.

Figure 11. Manual MOSFET Power ON in Timer Mode

Programming (continued)

Figure 12. Manual MOSFET Power ON in One Shot Mode
8.5.2.1 DELAY/M_DRV

A resistance in the range between 500Ω and 170kΩ must be connected to the DELAY/M_DRV pin in order to select a valid time interval. At the POR and during the reading of the resistance, the DELAY/M_DRV is connected to an analog signal chain through a mux. After the reading of the resistance, the analog circuit is switched off and the DELAY/M_DRV is connected to a digital circuit.

In this state, a logic HIGH applied to the DELAY/M_DRV pin is interpreted by the TPL5110-Q1 as a manual power ON. The manual power ON detection is provided with a de-bounce feature (on both edges) which makes the TPL5110-Q1 insensitive to the glitches on the DELAY/M_DRV.

The M_DRV must stay high for at least 20ms to be valid. Once a valid signal at DELAY/M_DRV is understood as a manual power on, the DRV signal will be asserted in the next 10ms. Its duration will be according to the programmed time interval (minus 50ms), or less if the DONE is received.

A manual power ON signal resets all the counters. The counters will restart as soon as a valid manual power ON signal is recognized and the signal at DELAY/M_DRV pin is asserted LOW. Due to the asynchronous nature of the manual power ON signal and its arbitrary duration, the LOW status of the DRV signal may be affected by an uncertainty of about ±5ms.

An extended assertion of a logic HIGH at the DELAY/M_DRV pin will turn on the MOSFET for a time longer than the programmed time interval. DONE signals received while the DELAY/M_DRV is HIGH are ignored. If the DRV is already LOW (MOSFET ON) the manual power ON is ignored.

8.5.2.2 Circuitry

The manual Power ON may be implemented using a switch (momentary mechanical action). The TPL5110-Q1 offers 2 possible approaches according to the power consumption constraints of the application.

Programming (continued)

Figure 13. Manual MOSFET Power ON with SPST Switch

For use cases that do not require the lowest power consumption, using a single pole single throw switch may offer a lower cost solution. The DELAY/M_DRV pin may be directly connected to VDD with R_{EXT} in the circuit. The current drawn from the supply voltage during the manual power ON is given by VDD/R_{EXT} .

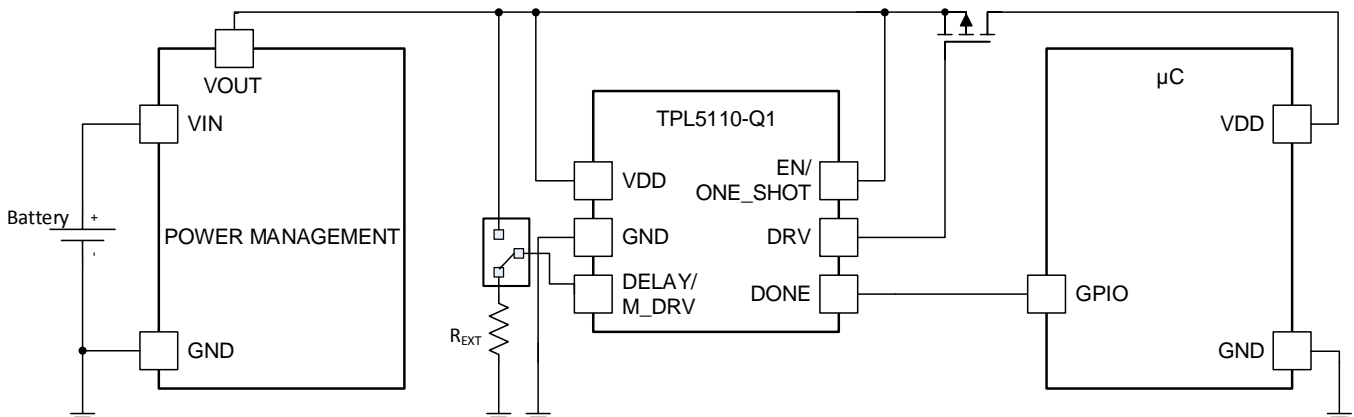

Figure 14. Manual MOSFET Power ON with SPDT Switch

The manual MOSFET Power ON function may also be asserted by switching DELAY/M_DRV from R_{EXT} to VDD using a single pole double throw switch, which will provide a lower power solution for the manual power ON, because no current flows.

8.5.3 Selection of the External Resistance

In order to set the time interval, the external resistance R_{EXT} is selected according the following formula:

$$R_{EXT} = 100 \left(\frac{-b + \sqrt{b^2 - 4a(c - 100T)}}{2a} \right) \tag{1}$$

Where:

- **T** is the desired time interval in seconds.
- **R_{EXT}** is the resistance value to use in Ω .
- **a, b, c** are coefficients depending on the range of the time interval.

Programming (continued)
Table 2. Coefficients for Equation 1

SET	Time Interval Range (s)	a	b	c
1	1 < T ≤ 5	0.2253	-20.7654	570.5679
2	5 < T ≤ 10	-0.1284	46.9861	-2651.8889
3	10 < T ≤ 100	0.1972	-19.3450	692.1201
4	100 < T ≤ 1000	0.2617	-56.2407	5957.7934
5	T > 1000	0.3177	-136.2571	34522.4680

EXAMPLE

Required time interval: 8s

The coefficient set to be selected is the number 2. The formula becomes

$$R_{EXT} = 100 \left(\frac{46.9861 - \sqrt{46.9861^2 + 4 * 0.1284 (-2651.8889 - 100 * 8)}}{2 * 0.1284} \right) \quad (2)$$

The resistance value is 10.18 kΩ.

 The following Look-Up-Tables contain example values of t_{IP} and their corresponding value of R_{EXT}.

Table 3. First 9 Time Intervals

t _{IP} (ms)	Resistance (Ω)	Closest real value (Ω)	Parallel of two 1% tolerance resistors, (kΩ)

8.5.4 Quantization Error

The TPL5110-Q1 can generate 1650 discrete timer intervals in the range of 100ms to 7200s. The first 9 intervals are multiples of 100ms. The remaining 1641 intervals cover the range between 1s to 7200s. Because they are discrete intervals, there is a quantization error associated with each value.

The quantization error can be evaluated according to the following formula:

$$Err = 100 \frac{(T_{DESIRED} - T_{ADC})}{T_{DESIRED}} \quad (3)$$

Where:

$$T_{ADC} = INT \left[\frac{1}{100} \left(a \frac{R_D^2}{100} + b \frac{R_D}{100} + c \right) \right] \quad (4)$$

$$R_D = INT \left[\frac{R_{EXT}}{100} \right] \quad (5)$$

R_{EXT} is the resistance calculated with Equation 1 and a,b,c are the coefficients of the equation listed in Table 2.

8.5.5 Error Due to Real External Resistance

R_{EXT} is a theoretical value and may not be available in standard commercial resistor values. It is possible to closely approach the theoretical R_{EXT} using two or more standard values in parallel. However, standard values are characterized by a certain tolerance. This tolerance will affect the accuracy of the time interval.

The accuracy can be evaluated using the following procedure:

1. Evaluate the min and max values of R_{EXT} (R_{EXT_MIN} , R_{EXT_MAX} with Equation 1 using the selected commercial resistance values and their tolerances.
2. Evaluate the time intervals ($T_{ADC_MIN}[R_{EXT_MIN}]$, $T_{ADC_MAX}[R_{EXT_MAX}]$) with Equation 4.
3. Find the errors using Equation 3 with T_{ADC_MIN} , T_{ADC_MAX} .

The results of the formula indicate the accuracy of the time interval.

The example below illustrates the procedure.

- Desired time interval , $T_{desired} = 600s$,

- Required R_{EXT} , from [Equation 1](#), $R_{EXT} = 57.44\text{k}\Omega$.

From [Table 4](#) R_{EXT} can be built with a parallel combination of two commercial values with 1% tolerance: $R1 = 107\text{k}\Omega$, $R2 = 124\text{k}\Omega$. The uncertainty of the equivalent parallel resistance can be found using:

$$uR_{//} = R_{//} \sqrt{\left(\frac{u_{R1}}{R1}\right)^2 + \left(\frac{u_{R2}}{R2}\right)^2} \quad (6)$$

Where u_{Rn} ($n=1,2$) represent the uncertainty of a resistance,

$$u_{Rn} = Rn \frac{\textit{Tolerance}}{\sqrt{3}} \quad (7)$$

The uncertainty of the parallel resistance is 0.82%, meaning the value of R_{EXT} may range between $R_{EXT_MIN} = 56.96\text{ k}\Omega$ and $R_{EXT_MAX} = 57.90\text{ k}\Omega$.

Using these value of R_{EXT} , the digitized timer intervals calculated with [Equation 4](#) are respectively $T_{ADC_MIN} = 586.85\text{ s}$ and $T_{ADC_MAX} = 611.3\text{ s}$, giving an error range of -1.88% / $+2.19\%$. The asymmetry of the error range is due to the quadratic transfer function of the resistance digitizer.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

In battery powered applications one design constraint is the need for low current consumption. The TPL5110-Q1 is suitable in applications where there is a need to monitor environmental conditions at a fixed time interval. Often in these applications a watchdog or other internal timer in a μC is used to implement a wakeup function. Typically, the power consumption of these functions is not optimized. Using the TPL5110-Q1 to implement a periodical power gating of the μC or of the entire system the current consumption will be only tens of nA.

9.2 Typical Application

The TPL5110-Q1 can be used in environment sensor nodes such as humidity and temperature sensor node. The sensor node has to measure the humidity and the temperature and transmit the data through a low power RF micro such as the CC2531. Since the temperature and the humidity in home application do not change so fast, the measurement and the transmission of the data can be done at very low rate, such as every 30 seconds. The RF micro should spend most of the time in counting the elapsed time, but using the TPL5110-Q1 it is possible to complete turn off the RF micro and extend the battery life. The TPL5110-Q1 will turn on the RF micro when the programmed time interval elapses or for debug purpose with the manual MOSFET Power ON switch.

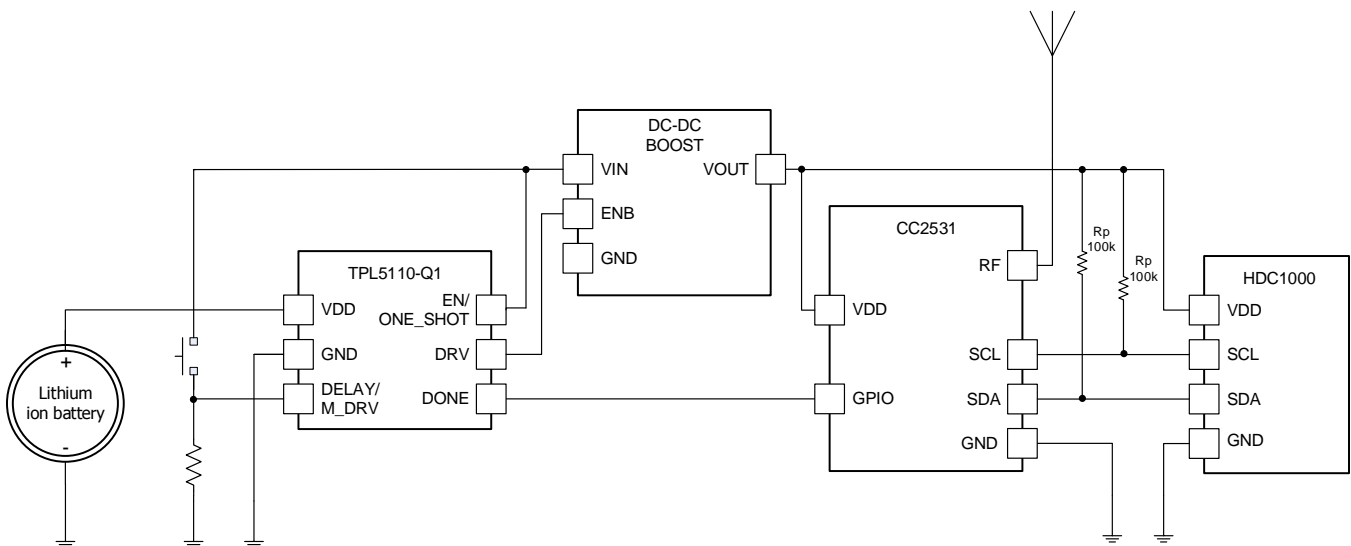

Figure 15. Sensor Node

9.2.1 Design Requirements

The Design is driven by the low current consumption constraint. The data are usually acquired on a rate which is in the range between 30s and 60s. The highest necessity is the maximization of the battery life. The TPL5110-Q1 helps achieve this goal because it allows turning off the RF micro.

9.2.2 Detailed Design Procedure

When the focal constraint is the battery life, the selection of a low power voltage regulator and low leakage MOSFET to power gate the μC is mandatory. The first step in the design is the calculation of the power consumption of each device in the different mode of operations. An example is the HDC1000, in measurement mode the RF micro is in normal operation and transmission. The different modes offer the possibility to select the appropriate time interval which respect the application constraint and maximize the life of the battery.

Typical Application (continued)

9.2.3 Application Curves

10 Power Supply Recommendations

The TPL5110-Q1 requires a voltage supply within 1.8 V and 5.5 V. A multilayer ceramic bypass X7R capacitor of 0.1 μ F between VDD and GND pin is recommended.

11 Layout

11.1 Layout Guidelines

The DELAY/M_DRV pin is sensitive to parasitic capacitance. It is suggested that the traces connecting the resistance on this pin to GROUND be kept as short as possible to minimize parasitic capacitance. This capacitance can affect the initial set up of the time interval. Signal integrity on the DRV pin is also improved by keeping the trace length between the TPL5110-Q1 and the gate of the MOSFET short to reduce the parasitic capacitance. The EN/ONE_SHOT needs to be tied to GND or VDD with short traces.

12 器件和文档支持

12.1 接收文档更新通知

要接收文档更新通知，请导航至 TI.com 上的器件产品文件夹。请单击右上角的 [通知我](#) 进行注册，即可收到任意产品信息更改每周摘要。有关更改的详细信息，请查看任意已修订文档中包含的修订历史记录。

12.2 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

TI E2E™ 在线社区 [TI 的工程师对工程师 \(E2E\) 社区](#)。此社区的创建目的在于促进工程师之间的协作。在 e2e.ti.com 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

设计支持 [TI 参考设计支持](#) 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

12.3 商标

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 机械、封装和可订购信息

以下页面包括机械、封装和可订购信息。这些信息是指定器件的最新可用数据。这些数据发生变化时，我们可能不会另行通知或修订此文档。如欲获取此产品说明书的浏览器版本，请参见左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPL5110QDDCRQ1	ACTIVE	SOT-23-THIN	DDC	6	3000	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 125	13ZX	Samples
TPL5110QDDCTQ1	ACTIVE	SOT-23-THIN	DDC	6	250	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 125	13ZX	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
