

具有可配置电压转换、三态输出和总线保持输入的 **SN74AXCH1T45** 1 位双电源总线收发器

1 特性

- 完全可配置的双电源轨设计可允许各个端口在 0.65V 至 3.6V 的电源电压范围内运行
- 工作温度: -40°C 至 +125°C
- 无干扰电源定序
- 总线保持数据输入消除了对外部上拉或下拉电阻的需求
- 最大静态电流 ($I_{CCA} + I_{CCB}$) 为 8 μ A (最高 85°C) 和 14 μ A (最高 125°C)
- 从 1.8V 转换到 3.3V 时, 支持高达 500Mbps 的转换速率
- V_{CC} 隔离特性
 - 如果任何一个 V_{CC} 输入低于 100mV, 则所有 I/O 输出均禁用且处于高阻抗状态
- I_{off} 支持局部关断模式运行
- 闩锁性能超出 JESD 78 II 类规范要求的 100mA
- 静电放电 (ESD) 保护性能超过 JESD 22 规范的要求
 - 8000V 人体放电模型
 - 1000V 充电器件模型

2 应用

- 个人电子产品
- 企业与通信
- 无线基础设施
- 楼宇自动化
- 电子销售终端
- 企业级固态硬盘

3 说明

SN74AXCH1T45 是一款采用两个独立可配置电源轨的单比特位同相总线收发器。 V_{CCA} 和 V_{CCB} 电源电压低至 0.65V 时, 该器件可正常工作。A 端口用于跟踪 V_{CCA} , 该端口可支持 0.65V 至 3.6V 范围内的任何电源电压。B 端口用于跟踪 V_{CCB} , 该端口也可支持 0.65V 至 3.6V 范围内的任何电源电压。此外, SN74AXCH1T45 还与单电源系统兼容。

DIR 引脚决定信号传播的方向。**DIR** 引脚配置为高电平时, 信号转换由端口 A 流向端口 B。**DIR** 配置为低电平时, 则由端口 B 流向端口 A。**DIR** 引脚以 V_{CCA} 为基准, 这意味着它的逻辑高电平和逻辑低电平阈值跟踪 V_{CCA} 电压。

有源总线保持电路会将未使用或未驱动的输入保持在有效逻辑状态。不建议在总线保持电路上使用上拉或下拉电阻器。如果 V_{CCA} 或 V_{CCB} 连上电源, 则总线保持电路分别在 A 端口或 B 端口上始终保持工作状态, 与方向控制引脚的状态无关。

该器件完全适用于使用 I_{off} 电流的局部掉电应用。当器件掉电时, I_{off} 保护电路可确保不从输入/输出或偏置到特定电压的快速 I/O 获取或向其提供多余电流。

V_{CC} 隔离特性可确保当 V_{CCA} 或 V_{CCB} 低于 100mV 时, I/O 端口均禁用其输出并进入高阻抗状态。

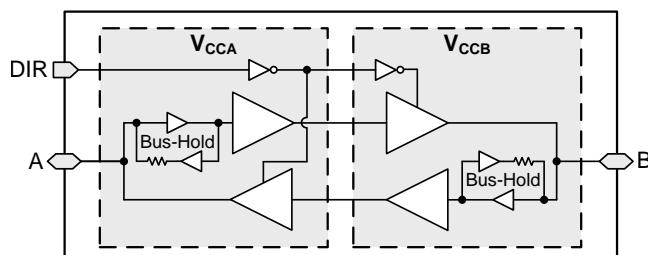

无干扰电源定序使电源轨能以任何顺序打开或关断, 从而提供强大的电源定序性能。

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input voltage and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The output positive-voltage rating may be exceeded up to 4.2 V maximum if the output current rating is observed.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±8000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

(1) V_{CCI} is the VCC associated with the input port.

(2) V_{CCO} is the VCC associated with the output port.

(3) All typical data is taken at 25°C.

(4) The bus-hold circuit can sink at least the minimum low sustaining current at V_{IL}(MAX). I_{BHL} should be measured after lowering V_I to GND and then raising it to V_{IL}(MAX).

(5) The bus-hold circuit can source at least the minimum high sustaining current at V_{IH}(MIN). I_{BHH} should be measured after raising V_I to V_{CC} and then lowering it to V_{IH}(MIN).

7 Parameter Measurement Information

7.1 Load Circuit and Voltage Waveforms

Unless otherwise noted, all input pulses are supplied by generators having the following characteristics:

- $f = 1 \text{ MHz}$
- $Z_O = 50 \Omega$
- $dv/dt \leq 1 \text{ ns/V}$

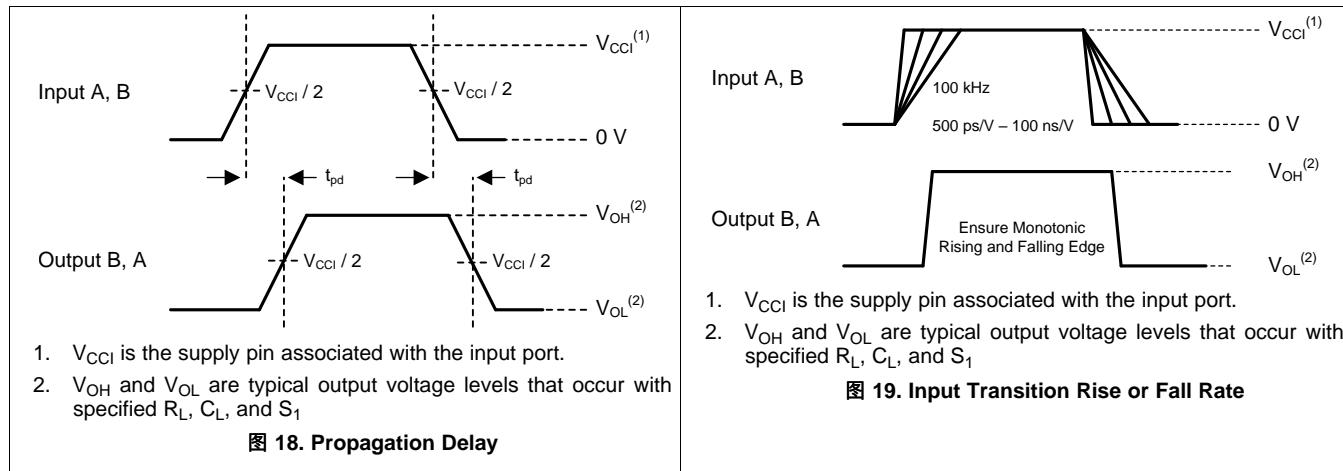

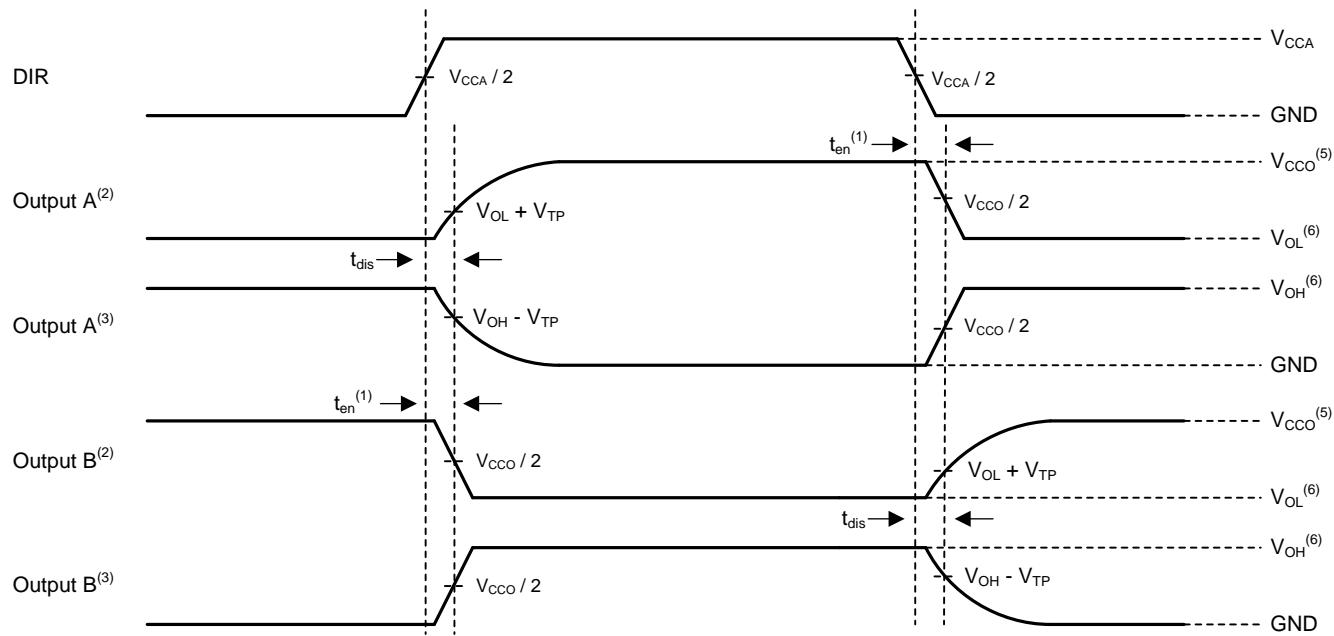

(1) C_L includes probe and jig capacitance.

8 Detailed Description

8.1 Overview

The SN74AXCH1T45 is single-bit, dual-supply, noninverting voltage level translator. Pin A and the direction control pin are referenced to V_{CCA} logic levels and pin B is referenced to V_{CCB} logic levels, as depicted in . The A port can accept I/O voltages ranging from 0.65 V to 3.6 V, and the B port can accept I/O voltages from 0.65 V to 3.6 V. A logic high on the DIR pin enables data transmission from A to B and a logic low on the DIR pin enables data transmission from B to A.

8.2 Functional Block Diagram

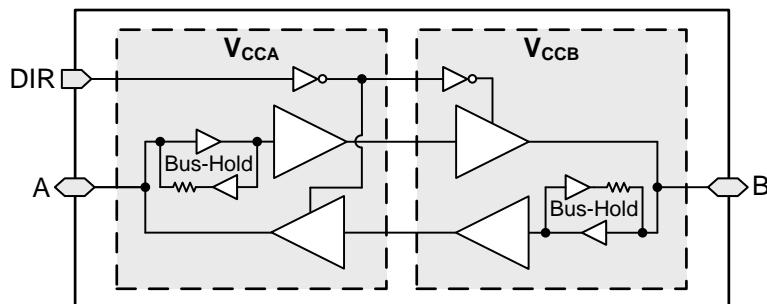

图 21. Functional Block Diagram

8.3 Feature Description

8.3.1 Standard CMOS Inputs

Standard CMOS inputs are high impedance and are typically modeled as a resistor in parallel with the input capacitance given in the [Electrical Characteristics](#). The worst case resistance is calculated with the maximum input voltage, given in the [Absolute Maximum Ratings](#), and the maximum input leakage current, given in the [Electrical Characteristics](#), using ohm's law ($R = V \div I$).

Signals applied to the inputs need to have fast edge rates, as defined by $\Delta t/\Delta v$ in [Recommended Operating Conditions](#) to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the standard CMOS input.

8.3.2 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The electrical and thermal limits defined in the [Absolute Maximum Ratings](#) must be followed at all times.

8.3.3 Partial Power Down (I_{off})

The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the [Electrical Characteristics](#).

8.3.4 V_{CC} Isolation

The inputs and outputs for this device enter a high-impedance state when either supply is <100mV.

8.3.5 Over-voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage so long as they remain below the maximum input voltage value specified in the [Recommended Operating Conditions](#).

Feature Description (接下页)

8.3.6 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [图 22](#).

CAUTION

Voltages beyond the values specified in the [Absolute Maximum Ratings](#) table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

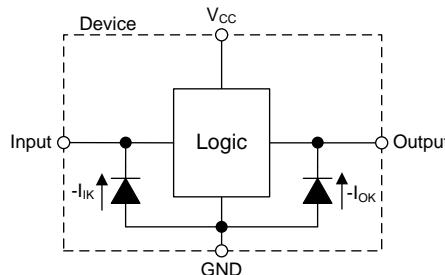

图 22. Electrical Placement of Clamping Diodes for Each Input and Output

8.3.7 Fully Configurable Dual-Rail Design

Both the V_{CCA} and V_{CCB} pins can be supplied at any voltage from 0.65 V to 3.6 V, making the device suitable for translating between any of the voltage nodes (0.7 V, 0.8 V, 0.9 V, 1.2 V, 1.8 V, 2.5 V and 3.3 V).

8.3.8 Supports High-Speed Translation

The SN74AXCH1T45 device can support high data-rate applications. The translated signal data rate can be up to 500 Mbps when the signal is translated from 1.8 V to 3.3 V.

8.3.9 Bus-Hold Data Inputs

Each data input on this device includes a weak latch that maintains a valid logic level on the input. The state of these latches is unknown at startup and remains unknown until the input has been forced to a valid high or low state. After data has been sent through a channel, the latch then maintains the previous state on the input if the line is left floating. It is not recommended to use pull-up or pull-down resistors together with a bus-hold input, as it may cause undefined inputs to occur which leads to excessive current consumption.

Bus-hold data inputs prevent floating inputs on this device. The [Implications of Slow or Floating CMOS Inputs](#) application report explains the problems associated with leaving CMOS inputs floating.

These latches remain active at all times, independent of all control signals such as direction control or output enable.

The [Bus-Hold Circuit](#) application report has additional details regarding bus-hold inputs.

8.4 Device Functional Modes

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The SN74AXCH1T45 device can be used in level-translation applications for interfacing devices or systems with one another when they are operating at different interface voltages. The maximum data rate can be up to 500 Mbps when the device translate signals from 1.8 V to 3.3 V.

9.1.1 Enable Times

Calculate the enable times for the SN74AXC1T45 using the following formulas:

$$t_{PZH} (\text{DIR to A}) = t_{PLZ} (\text{DIR to B}) + t_{PLH} (\text{B to A}) \quad (1)$$

$$t_{PZL} (\text{DIR to A}) = t_{PHZ} (\text{DIR to B}) + t_{PHL} (\text{B to A}) \quad (2)$$

$$t_{PZH} (\text{DIR to B}) = t_{PLZ} (\text{DIR to A}) + t_{PLH} (\text{A to B}) \quad (3)$$

$$t_{PZL} (\text{DIR to B}) = t_{PHZ} (\text{DIR to A}) + t_{PHL} (\text{A to B}) \quad (4)$$

In a bidirectional application, these enable times provide the maximum delay time from the time the DIR bit is switched until an output is expected. For example, if the SN74AXCH1T45 initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.

9.2 Typical Applications

9.2.1 Interrupt Request Application

图 24 shows an example of the SN74AXCH1T45 being used in an application where a system controller flags an interrupt request (IRQ) to the CPU. The system controller determines the direction of the IRQ line to either flag an interrupt to the CPU or allow the CPU to drive data on the line. In this application the controller is operating at 3.3 V while the CPU can be operating as low as 0.65 V.

The SN74AXCH1T45 device is used to ensure that these devices can communicate at the appropriate voltage levels. Because the SN74AXCH1T45 does not have an output-enable (OE) pin, the system designer should take precautions to avoid bus contention between the CPU and controller when changing directions.

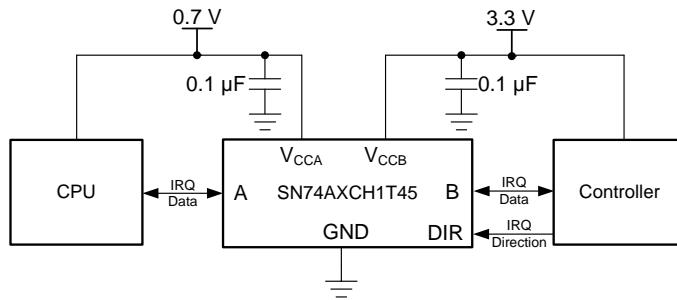

图 24. Interrupt Request Application

9.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 11.

Typical Applications (接下页)

表 11. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUES
Input voltage range	0.65 V to 3.6 V
Output voltage range	0.65 V to 3.6 V

9.2.1.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
 - Use the supply voltage of the device that is driving the SN74AXCH1T45 device to determine the input voltage range. For a valid logic-high, the value must exceed the high-level input voltage (V_{IH}) of the input port. For a valid logic low the value must be less than the low-level input voltage (V_{IL}) of the input port.
- Output voltage range
 - Use the supply voltage of the device that the SN74AXCH1T45 device is driving to determine the output voltage range.

10 Power Supply Recommendations

Always apply a ground reference to the GND pins first. This device is designed for glitch free power sequencing without any supply sequencing requirements such as ramp order or ramp rate.

This device was designed with various power supply sequencing methods in mind to help prevent unintended triggering of downstream devices. For more information regarding the power up glitch performance of the AXC family of level translators, see the [Power Sequencing for AXC Family of Devices](#) application report

11 Layout

11.1 Layout Guidelines

To ensure reliability of the device, following common printed-circuit board layout guidelines are recommended:

- Use bypass capacitors on the power supply pins and place them as close to the device as possible.
- Use short trace lengths to avoid excessive loading.

12.5 静电放电警告

 ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。
 ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
