

DAC7612

Dual, 12-Bit Serial Input DIGITAL-TO-ANALOG CONVERTER

FEATURES

- **LOW POWER:** 3.7mW
- **FAST SETTLING:** 7 μ s to 1 LSB
- **1mV LSB WITH 4.095V FULL-SCALE RANGE**
- **COMPLETE WITH REFERENCE**
- **12-BIT LINEARITY AND MONOTONICITY OVER INDUSTRIAL TEMP RANGE**
- **3-WIRE INTERFACE:** Up to 20MHz Clock
- **SMALL PACKAGE:** 8-Lead SOIC

APPLICATIONS

- **PROCESS CONTROL**
- **DATA ACQUISITION SYSTEMS**
- **CLOSED-LOOP SERVO-CONTROL**
- **PC PERIPHERALS**
- **PORTABLE INSTRUMENTATION**

DESCRIPTION

The DAC7612 is a dual, 12-bit digital-to-analog converter (DAC) with guaranteed 12-bit monotonicity performance over the industrial temperature range. It requires a single +5V supply and contains an input shift register, latch, 2.435V reference, a dual DAC, and high speed rail-to-rail output amplifiers. For a full-scale step, each output will settle to 1 LSB within 7 μ s while only consuming 3.7mW.

The synchronous serial interface is compatible with a wide variety of DSPs and microcontrollers. Clock (CLK), Serial Data In (SDI), Chip Select (\overline{CS}) and Load DACs (LOADDACs) comprise the serial interface.

The DAC7612 is available in an 8-lead SOIC package and is fully specified over the industrial temperature range of -40°C to +85°C.

SPECIFICATIONS

At $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$, and $V_{DD} = +5\text{V}$, unless otherwise noted.

NOTE: (1) Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

OPERATION

The DAC7612 is a dual, 12-bit digital-to-analog converter (DAC) complete with a serial-to-parallel shift register, DAC registers, laser-trimmed 12-bit DACs, on-board reference, and rail-to-rail output amplifiers. Figure 1 shows the basic operation of the DAC7612.

INTERFACE

Figure 1 shows the basic connection between a microcontroller and the DAC7612. The interface consists of a Serial Clock (CLK), Serial Data (SDI), and a Load DAC signal (LOADDACS). In addition, a chip select ($\overline{\text{CS}}$) input is available to enable serial communication when there are multiple serial devices. Loading either DAC A or DAC B is done by shifting 14 serial bits in via the SDI input. The first 2 bits represent the address of the DAC to be updated and the

next 12 bits are the code (MSB-first) sent to the DAC. The data format is Straight Binary and is loaded MSB-first into the shift registers after loading the address bits. Table I shows the relationship between input code and output voltage.

The digital data into the DAC7612 is double-buffered. This means that new data can be entered into the chosen DAC without disturbing the old data and the analog output of the converter. At some point after the data has been entered into the serial shift register, this data can be transferred into the DAC registers. This transfer is accomplished with a HIGH to LOW transition of the $\overline{\text{LOADDACS}}$ pin. The $\overline{\text{LOADDACS}}$ pin makes the DAC registers transparent. If new data is shifted into the shift register while $\overline{\text{LOADDACS}}$ is LOW, the DAC output voltages will change as each new bit is entered. To prevent this, $\overline{\text{LOADDACS}}$ must be returned HIGH prior to shifting in new serial data.

DIGITAL-TO-ANALOG CONVERTER

The internal DAC section is a 12-bit voltage output device that swings between ground and the internal reference voltage. The DAC is realized by a laser-trimmed R-2R ladder network which is switched by N-channel MOSFETs. Each DAC output is internally connected to a rail-to-rail output operational amplifier.

OUTPUT AMPLIFIER

A precision, low-power amplifier buffers the output of each DAC section and provides additional gain to achieve a 0V to 4.095V range. Each amplifier has low offset voltage, low

noise, and a set gain of 1.682V/V (4.095/2.435). See Figure 2 for an equivalent circuit schematic of the analog portion of the DAC7612.

The output amplifier has a 7 μ s typical settling time to ± 1 LSB of the final value. Note that there are differences in the settling time for negative-going signals versus positive-going signals.

The rail-to-rail output stage of the amplifier provides the full-scale range of 0V to 4.095V while operating on a supply voltage as low as 4.75V. In addition to its ability to drive resistive loads, the amplifier will remain stable while driving capacitive loads of up to 500pF. See Figure 3 for an equivalent circuit schematic of the amplifier's output driver and the Typical Performance Curves section for more information regarding settling time, load driving capability, and output noise.

POWER SUPPLY

A BiCMOS process and careful design of the bipolar and CMOS sections of the DAC7612 result in a very low power device. Bipolar transistors are used where tight matching and low noise are needed to achieve analog accuracy, and CMOS transistors are used for logic, switching functions and for other low power stages.

If power consumption is critical, it is important to keep the logic levels on the digital inputs (SDI, CLK, $\overline{\text{CS}}$, LOADDACS) as close as possible to either V_{DD} or ground. This will keep the CMOS inputs (see "Supply Current vs Logic Input Voltages" in the Typical Performance Curves) from shunting current between V_{DD} and ground.

The DAC7612 power supply should be bypassed as shown in Figure 1. The bypass capacitors should be placed as close to the device as possible, with the 0.1 μ F capacitor taking priority in this regard. The "Power Supply Rejection vs Frequency" graph in the Typical Performance Curves section shows the PSRR performance of the DAC7612. This should be taken into account when using switching power supplies or DC/DC converters.

In addition to offering guaranteed performance with V_{DD} in the 4.75V to 5.25V range, the DAC7612 will operate with reduced performance down to 4.5V. Operation between 4.5V and 4.75V will result in longer settling time, reduced performance, and current sourcing capability. Consult the " V_{DD} vs Load Current" graph in the Typical Performance Curves section for more information.

APPLICATIONS

POWER AND GROUNDING

The DAC7612 can be used in a wide variety of situations—from low power, battery operated systems to large-scale industrial process control systems. In addition, some applications require better performance than others, or are particularly sensitive to one or two specific parameters. This diversity makes it difficult to define definite rules to follow concerning the power supply, bypassing, and grounding. The following discussion must be considered in relation to the desired performance and needs of the particular system.

A precision analog component requires careful layout, adequate bypassing, and a clean, well-regulated power supply. As the DAC7612 is a single-supply, +5V component, it will often be used in conjunction with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it will be to achieve good performance.

Because the DAC7612 has a single ground pin, all return currents, including digital and analog return currents, must flow through this pin. The GND pin is also the ground

reference point for the internal bandgap reference. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they are connected at the power entry point of the system (see Figure 4).

The power applied to V_{DD} should be well regulated and low-noise. Switching power supplies and DC/DC converters will often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between V_{DD} and V_{OUT} .

As with the GND connection, V_{DD} should be connected to a +5V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. In addition, the 10 μ F and 0.1 μ F capacitors shown in Figure 4 are strongly recommended and should be installed as close to V_{DD} and ground as possible. In some situations, additional bypassing may be required such as a 100 μ F electrolytic capacitor or even a “Pi” filter made up of inductors and capacitors—all designed to essentially lowpass filter the +5V supply, removing the high frequency noise (see Figure 4).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
