

14-位, 2 MSPS, 双通道, 差分/单端, 超低功耗模数转换器

查询样品: [ADS7945](#), [ADS7946](#)

特性

- 取样率: **2 MSPS**
- **14-位**, 与 **8/10/12-位** [ADS7947/8/9](#) 系列产品 ([ADS7946](#)) 引脚兼容
- 突出的性能:
 - **SNR: 84 dB (ADS7945)**
 - 无丢码
 - **INL: 1.5 LSB (最大) (ADS7945)**
- 低功耗:
 - 在 **2 MSPS** 运行模式下, **11.6 mW**
 - 低速状态下自动功率降低:
 - 在 **500 kSPS** 模式下 **7.2 mW**
 - 在 **100 kSPS** 模式下 **1.4 mW**
 - 在 **20 kSPS** 模式下 **0.3 mW**
- 宽电源范围:
 - 模拟: **2.7 V 至 5.25 V**
 - 数字: **1.65 V 至 AVDD**
- 简单串口 (**SPI**)
- 完全指定温度范围从 **–40°C 到 +125°C**
- 微笑器件封装: **3 mm × 3 mm QFN**

应用范围

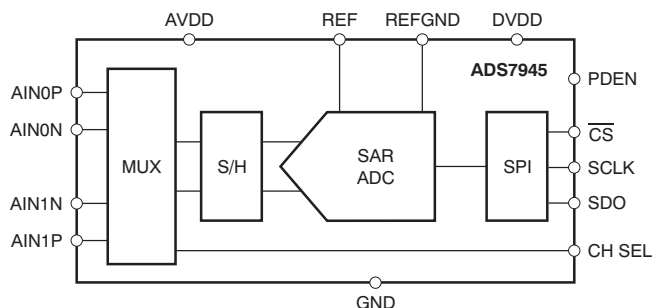

- 光纤网络
- 医疗仪表
- 电池供电设备
- 数据采集系统

说明

ADS7945/6 是 14-为, 2 MSPS 模数转换器 (ADCs), 它们分别具有差分 and 单端输入。此设备 运行在 2 MSPS 具有一个标准 16 时钟数据帧的采样速率。此设备特有突出的 dc 精度和出色的动态性能; [ADS7946](#) 与 [8/10/12-位 ADS7947/8/9](#) 设备引脚兼容。此设备包含一个 2 通道输入复用器和一个低功率逐次逼近寄存器 (SAR), 此寄存器具有一个固有的取样保持输入级。

ADS7945/6 支持较宽的模拟供电范围, 允许的全尺寸输入范围已拓展到 $\pm 5\text{ V}$ 差分或者 5 V 单端范围。一个简单的 **SPI™**, 具有数字供电, 能在低至 1.65 V 的电压下运行, 能很容易的与多种数字控制器建立端口连接。当运行在较低速度时, 自动掉电可被启用以大幅减少功率消耗。

封装方式为微小 $3\text{ mm} \times 3\text{ mm}$ QFN, ADS7945/6 完全额定工作温度范围从 -40°C 至 $+125^{\circ}\text{C}$ 并适合多种数据采集应用, 在这里, 高性能, 低功耗和小封装尺寸是关键。

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SPI is a trademark of Motorola.

All other trademarks are the property of their respective owners.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

FAMILY AND ORDERING INFORMATION⁽¹⁾

| PRODUCT | RESOLUTION (Bits) | INPUT |
|---------|-------------------|------------------------|
| ADS7945 | 14 | Unipolar, differential |
| ADS7946 | 14 | Unipolar, single-ended |
| ADS7947 | 12 | Unipolar, single-ended |
| ADS7948 | 10 | Unipolar, single-ended |
| ADS7949 | 8 | Unipolar, single-ended |

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

| | VALUE | UNIT |
|--|----------------------------|------|
| AINxP to GND or AINxN to GND (ADS7945) | –0.3 to AVDD + 0.3 | V |
| AINx to GND (ADS7946) | –0.3 to AVDD + 0.3 | V |
| AINxGND to GND (ADS7946) | –0.3 to +0.3 | V |
| AVDD to GND or DVDD to GND | –0.3 to 7 | V |
| Digital input voltage to GND | –0.3 to DVDD + 0.3 | V |
| Digital output to GND | –0.3 to DVDD + 0.3 | V |
| Operating temperature range | –40 to +125 | °C |
| Storage temperature range | –65 to +150 | °C |
| ESD ratings | Human body model (HBM) | 2000 |
| | Charged device model (CDM) | 500 |
| | Machine model (MM) | 200 |

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *electrical characteristics* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS: ADS7945 (Differential)

Minimum/maximum specifications at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $\text{AVDD} = 2.7\text{ V}$ to 5.25 V , $\text{DVDD} = 1.65\text{ V}$ to AVDD , input common-mode = $V_{\text{REF}}/2 \pm 0.2$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$, unless otherwise noted.

Typical specifications at $T_A = +25^{\circ}\text{C}$, $\text{AVDD} = 5\text{ V}$, $\text{DVDD} = 1.8\text{ V}$, input common-mode = $V_{\text{REF}}/2 \pm 0.2$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNITS |

| Signal-to-noise and distortion ratio (SINAD) | 20 kHz, $V_{\text{REF}} = 4.0\text{ V}$ | | 83.5 | | dB |
| Spurious-free dynamic range (SFDR) | 20 kHz, $V_{\text{REF}} = 4.0\text{ V}$ | | 94 | | dB |
| Full-power bandwidth ⁽⁸⁾ | At -3 dB | | 15 | | MHz |

- (1) Ideal input span; does not include gain or offset error.
- (2) Refer to the [Input Common-Mode Range](#) section in Application Information.
- (3) Refer to [Figure 76](#) for sampling circuit details.
- (4) LSB means least significant bit.
- (5) Measured relative to an ideal full-scale input.
- (6) Ensured by simulation.
- (7) Calculated on the first nine harmonics of the input frequency.
- (8) Indicates signal bandwidth for undersampling applications.

ELECTRICAL CHARACTERISTICS: ADS7945 (Differential) (continued)

Minimum/maximum specifications at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $\text{AVDD} = 2.7\text{ V}$ to 5.25 V , $\text{DVDD} = 1.65\text{ V}$ to AVDD , input common-mode = $V_{\text{REF}}/2 \pm 0.2$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$, unless otherwise noted.

Typical specifications at $T_A = +25^{\circ}\text{C}$, $\text{AVDD} = 5\text{ V}$, $\text{DVDD} = 1.8\text{ V}$, input common-mode = $V_{\text{REF}}/2 \pm 0.2$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNITS | |
|------------------------------------|-----------------------------------|--|---------|-----|------|-------|----|
| DIGITAL INPUT/OUTPUT | | | | | | | |
| Logic family | | CMOS | | | | | |
| Logic level | V _{IH} | | 0.7DVDD | | | V | |
| | V _{IL} | | 0.3DVDD | | | V | |
| | V _{OH} | SDO load 20 pF | 0.8DVDD | | | V | |
| | V _{OL} | SDO load 20 pF | 0.2DVDD | | | V | |
| Input leakage current | I _{IH} , I _{IL} | 0 < V _{IN} < DVDD | ±20 | | | nA | |
| External reference | | | 2.5 | | | AVDD | V |
| POWER-SUPPLY REQUIREMENTS | | | | | | | |
| AVDD | | | 2.7 | 3.3 | 5.25 | V | |
| DVDD | | | 1.65 | 3.3 | AVDD | V | |
| AVDD supply current | I _{DYNAMIC} | AVDD = 3.3 V, f _{SAMPLE} = 2 MSPS | 3.5 | | | 4 | mA |
| | | AVDD = 5 V, f _{SAMPLE} = 2 MSPS | 4 | | | 5 | mA |
| | I _{STATIC} | AVDD = 3.3 V, SCLK off | 2.3 | | | | mA |
| | | AVDD = 5 V, SCLK off | 2.5 | | | 3 | mA |
| DVDD supply current ⁽⁹⁾ | | DVDD = 3.3 V, f _{SAMPLE} = 2 MSPS, SDO load 20 pF | 750 | | | | μA |
| Power-down state | I _{PD-DYNAMIC} | SCLK = 40 MHz | 550 | | | | μA |
| AVDD supply current | I _{PD-STATIC} | SCLK off | 2.5 | | | | μA |
| Power-up time | | From power-down state using PDEN pin | 1 | | | | μs |
| TEMPERATURE RANGE | | | | | | | |
| Specified performance | | | −40 | | | +125 | °C |

(9) DVDD consumes only dynamic current. $I_{\text{DVDD}} = C_{\text{LOAD}} \times \text{DVDD} \times \text{number of } 0 \rightarrow 1 \text{ transitions in SDO} \times f_{\text{SAMPLE}}$. This is a load-dependent current and there is no DVDD current when the output is not toggling.

ELECTRICAL CHARACTERISTICS: ADS7946 (Single-Ended)

Minimum/maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $AVDD = 2.7\text{ V}$ to 5.25 V , $DVDD = 1.65\text{ V}$ to $AVDD$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$, unless otherwise noted.

Typical specifications at $T_A = +25^\circ\text{C}$, $AVDD = 5\text{ V}$, $DVDD = 1.8\text{ V}$, and $f_{\text{SAMPLE}} = 2\text{ MSPS}$.

PARAMETER MEASUREMENT INFORMATION

TIMING DIAGRAM: ADS7945, ADS7946

Table 1. TIMING REQUIREMENTS: ADS7945, ADS7946⁽¹⁾⁽²⁾

| PARAMETER | TEST CONDITIONS ⁽²⁾ | MIN | TYP | MAX | UNIT |
|--|----------------------------------|-----|-----|------|------|
| t_{CONV} Conversion time | | | | 16 | SCLK |
| t_{ACQ} Acquisition time | | 80 | | | ns |
| f_{SAMPLE} Sample rate (throughput rate) | SCLK = 40 MHz, 16-clock frame | | | 2 | MSPS |
| t_{W1} Pulse width $\overline{\text{CS}}$ high | | 25 | | | ns |
| t_{D1} Delay time, $\overline{\text{CS}}$ low to first data (D0-15) out | DVDD = 1.8 V | | | 14.5 | ns |
| | DVDD = 3 V | | | 12.5 | ns |
| | DVDD = 5 V | | | 8.5 | ns |
| t_{SU1} Setup time, $\overline{\text{CS}}$ low to first rising edge of SCLK | DVDD = 1.8 V | 3.5 | | | ns |
| | DVDD = 3 V | 3.5 | | | ns |
| | DVDD = 5 V | 3.5 | | | ns |
| $t_{\text{D2}}^{(3)}$ Delay time, SCLK falling to SDO | DVDD = 1.8 V | | | 11 | ns |
| | DVDD = 3 V | | | 9 | ns |
| | DVDD = 5 V | | | 7.1 | ns |
| t_{H1} Hold time, SCLK falling to data valid | DVDD = 1.8 V | 4 | | | ns |
| | DVDD = 3 V | 3 | | | ns |
| | DVDD = 5 V | 2 | | | ns |
| t_{D3} Delay time, $\overline{\text{CS}}$ high to SDO 3-state | DVDD = 1.8 V | | | 15 | ns |
| | DVDD = 3 V | | | 12.5 | ns |
| | DVDD = 5 V | | | 8.5 | ns |
| t_{D4} Delay time $\overline{\text{CS}}$ rising edge from conversion end (refer to the t_{CONV} specification for conversion time) | | 10 | | | ns |
| t_{WH} Pulse duration, SCLK high | | 8 | | | ns |
| t_{WL} Pulse duration, SCLK low | | 8 | | | ns |
| SCLK frequency | | | | 40 | MHz |
| t_{PDSU} Setup time, PDEN high to $\overline{\text{CS}}$ rising edge (refer to Figure 84 and Figure 85) | | 2 | | | ns |
| t_{PDH} Hold time, $\overline{\text{CS}}$ rising edge to PDEN falling edge (refer to Figure 84) | | 20 | | | ns |

(1) All specifications are ensured by simulations at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, and DVDD = 1.65 V to AVDD, unless otherwise noted.

(2) 1.8 V specifications apply from 1.65 V to 2 V; 3 V specifications apply from 2.7 V to 3.6 V; 5 V specifications apply from 4.75 V to 5.25 V.

(3) With 20 pF load.

PIN CONFIGURATION ADS7945 (DIFFERENTIAL)

Table 2. PIN FUNCTIONS

| PIN NO. | PIN NAME | FUNCTION | DESCRIPTION |
|---------|-----------------|----------------|--|
| 1 | GND | Analog/digital | Power supply ground; all analog and digital signals are referred with respect to this pin |
| 2 | AVDD | Analog | ADC power supply |
| 3 | REF | Analog | ADC positive reference input; decouple this pin with REFGND |
| 4 | REFGND | Analog | Reference return; short to analog ground plane |
| 5 | AIN0P | Analog input | Positive analog input, channel 0 |
| 6 | AIN0N | Analog input | Negative analog input, channel 0 |
| 7 | AIN1N | Analog input | Negative analog input, channel 1 |
| 8 | AIN1P | Analog input | Positive analog input, channel 1 |
| 9 | NC | — | Not connected internally, it is recommended to externally short this pin to GND |
| 10 | NC | — | Not connected internally, it is recommended to externally short this pin to GND |
| 11 | CH SEL | Digital input | This pin selects the analog input channel. Low = Channel 0 High = Channel 1 It is recommended to change the channel within a window of one clock; from half a clock after the \overline{CS} falling edge. This change ensures the settling on the multiplexer output before the sample start. |
| 12 | PDEN | Digital input | This pin enables a power-down feature if it is high at the \overline{CS} rising edge |
| 13 | \overline{CS} | Digital input | Chip select signal; active low |
| 14 | SCLK | Digital input | Serial SPI clock |
| 15 | SDO | Digital output | Serial data out |
| 16 | DVDD | Digital | Digital I/O supply |

PIN CONFIGURATION ADS7946 (SINGLE-ENDED)

Table 3. PIN FUNCTIONS

| PIN NO. | PIN NAME | FUNCTION | DESCRIPTION |
|---------|-----------------|----------------|--|
| 1 | GND | Analog/digital | Power supply ground; all analog and digital signals are referred with respect to this pin |
| 2 | AVDD | Analog | ADC power supply |
| 3 | REF | Analog | ADC positive reference input; decouple this pin with REFGND |
| 4 | REFGND | Analog | Reference return; short to analog ground plane |
| 5 | AIN0 | Analog input | Positive analog input, channel 0 |
| 6 | AIN0GND | Analog input | Ground sense analog input, channel 0 |
| 7 | AIN1GND | Analog input | Ground sense analog input, channel 1 |
| 8 | AIN1 | Analog input | Positive analog input, channel 1 |
| 9 | NC | — | Not connected internally, it is recommended to externally short this pin to GND |
| 10 | NC | — | Not connected internally, it is recommended to externally short this pin to GND |
| 11 | CH SEL | Digital input | This pin selects the analog input channel. Low = Channel 0 High = Channel 1 It is recommended to change the channel within a window of one clock; from half a clock after the \overline{CS} falling edge. This change ensures the settling on the multiplexer output before the sample start. |
| 12 | PDEN | Digital input | This pin enables a power-down feature if it is high at the \overline{CS} rising edge |
| 13 | \overline{CS} | Digital input | Chip select signal; active low |
| 14 | SCLK | Digital input | Serial SPI clock |
| 15 | SDO | Digital output | Serial data out |
| 16 | DVDD | Digital | Digital I/O supply |

TYPICAL CHARACTERISTICS: ADS7945

At $T_A = +25^\circ\text{C}$, $AVDD = 5\text{ V}$, $DVDD = 1.8\text{ V}$, $V_{REF} = 2.5\text{ V}$, and $f_{SAMPLE} = 2\text{ MSPS}$, unless otherwise noted.

OVERVIEW

The ADS7945 and ADS7946 are 14-bit, miniature, dual-channel, low-power SAR ADCs. The ADS7945 is a differential input device and the ADS7946 is a single-ended device with ground sensing input. These devices feature very low power consumption at rated speed. The PDEN pin enables an auto power-down mode that further reduces power consumption at lower speeds.

MULTIPLEXER AND ADC INPUT

The ADS7945/46 devices feature differential/single-ended inputs respectively with a double-pole, double-throw multiplexer. The analog input circuit shown in Figure 75 is similar for ADS7945 and ADS7946.

The ADS7945 features a differential input. Each of the positive (AINxP) and negative (AINxN) inputs can swing from $-V_{REF}/2$ to $+V_{REF}/2$ around the common-mode voltage $(AINxP + AINxN)/2$ so that AINxP and AINxN swing in opposite directions equally from common-mode voltage (differential input swing $V_{AINxP} - V_{AINxN}$ ranges from $-V_{REF}$ to $+V_{REF}$). The ADC converts the difference in voltage: $V_{AINxP} - V_{AINxN}$. This feature allows the devices to reject the common-mode noise in the input signal.

For the ADS7946, the ground sense inputs (AINxGND) can accept swings of ± 0.2 V whereas the inputs (AINx) allow signals in the range of 0 V to V_{REF} over the ground sense input. The ADC converts the difference in voltage: $V_{AINx} - V_{AINxGND}$. This feature can be used in multiple ways. For example, two signals can be connected from different sensors with unequal ground potentials (within ± 0.2 V) to a single ADC. The ADC rejects the common-mode offset and noise. This feature also allows the use of a single-supply op amp. The signal and the AINxGND input can be offset by $+0.2$ V, which provides the ground clearance required for a single-supply op amp.

Figure 75 shows the electrostatic discharge (ESD) diodes to supply and ground at every analog input. Make sure that these diodes do not turn on by keeping the supply voltage within the specified input range.

Figure 75. Analog Inputs

Figure 76 shows an equivalent circuit of the multiplexer and ADC sampling stage. See the [Application Information](#) section for details on the driving circuit. The positive and negative/ground sense inputs are separately sampled on 32 pF sampling capacitors. The multiplexer and sampling switches are represented by an ideal switch in series with a 12 Ω resistance. Note that this is dc resistance and can be used for step-settling calculations (do not use the RC values shown in Figure 76 for 3 dB bandwidth calculations for undersampling applications). During sampling, the devices connect the 32 pF sampling capacitor to the ADC driver. This connection creates a glitch at the device input. It is recommended to connect a capacitor across the AINxP and AINxN terminals or AINx and AINxGND terminals to reduce this glitch for the ADS7945 or ADS7946, respectively. A driving circuit must have sufficient bandwidth to settle this glitch within the acquisition time.

Figure 76. Input Sampling Stage Equivalent Circuit

Figure 77 shows a timing diagram for the ADC analog input channel selection. As shown in Figure 77, the CH SEL signal selects the analog input channel to the ADC. CH SEL = 0 selects channel 0 and CH SEL = 1 selects channel 1. It is recommended not to toggle the CH SEL signal during an ADC acquisition phase until the device sees the first valid SCLK rising edge after the device samples the analog input. If CH SEL is toggled during this period, it can cause erroneous output code because the device might see unsettled analog input.

CH SEL can be toggled at any time during the window specified in Figure 77; however, it is recommended to select the desired channel after the first SCLK rising edge and before the second SCLK rising edge. This timing ensures that the multiplexer output is settled before the ADC starts acquisition of the analog input.

Figure 77. ADC Analog Input Channel Selection

REFERENCE

The ADS7945/6 use an external reference voltage during the conversion of a sampled signal. The devices switch the capacitors used in the conversion process to the reference terminal during conversion. The switching frequency is the same as the SCLK frequency. It is necessary to decouple the REF terminal to REFGND with a 1 μ F ceramic capacitor in order to get the best noise performance from the device. The capacitor must be placed closest to these pins. The reference input can be driven with the REF50xx series precision references from TI. Figure 78 shows a typical reference driving circuit.

Sometimes it is convenient to use AVDD as a reference. The ADS7945/6 allow reference ranges up to AVDD. However, make sure that AVDD is well-bypassed and that there is a separate bypass capacitor between REF and REFGND.

(1) Select the appropriate device as described by the required reference value. For example, select the REF5040 for a 4 V reference, the REF5030 for a 3 V reference, and the REF5025 for a 2.5 V reference. Ensure that $(AVDD - REF) > 0.2 \text{ V}$ so that the REF50xx functions properly.

Figure 78. Typical Reference Driving Circuit

CLOCK

The ADS7945/6 use SCLK for conversions (typically 40 MHz). A lower frequency SCLK can be used for applications that require sample rates less than 2 MSPS. However, it is better to use a 40 MHz SCLK and slow down the device speed by choosing a lower frequency for CS, which allows more acquisition time. This configuration relaxes constraints on the output impedance of the driving circuit. Refer to the [Application Information](#) section for calculation of the driving circuit output impedance.

ADC TRANSFER FUNCTION

The ADS7945 is a differential input device and the ADS7946 is a single-ended input device. This section describes the transfer characteristics for both devices.

The ADS7945 output is in twos complement format. Figure 79 shows the ideal transfer characteristics for these devices. Here, full-scale range for the ADC input ($A_{INxP} - A_{INxN}$) is equal to twice the reference input voltage to the ADC $2 \times (V_{REF})$. 1 LSB is equal to $2 \times (V_{REF}/2^N)$, where N is the resolution of the ADC ($N = 14$ for the ADS7945). The differential input of the ADC is bipolar around the common-mode voltage $(A_{INxP} + A_{INxN})/2$ and has a range of positive FSR ($+V_{REF}$) to negative FSR ($-V_{REF}$).

Figure 79. ADS7945 Transfer Characteristics

The ADS7946 output is in straight binary format. Figure 80 shows ideal transfer characteristics for this device. Here, FSR is the full-scale range for the ADC input ($A_{INx} - A_{INxGND}$) and is equal to the reference input voltage to the ADC (V_{REF}). 1 LSB is equal to $(V_{REF}/2^N)$, where N is the resolution of the ADC ($N = 14$ for the ADS7946).

Figure 80. ADS7946 Transfer Characteristics

DEVICE OPERATION

The ADS7945/6 operate with either a 16-clock frame or 32-clock frame for ease of interfacing with the host processor.

16-CLOCK FRAME

Figure 81 shows the devices operating in 16-clock mode. This mode is the fastest mode for device operation. In this mode, the devices output data from previous conversions while converting the recently sampled signal.

As shown in Figure 81, the ADS7945/6 start acquisition of the analog input from the 16th falling edge of SCLK. The device samples the input signal on the \overline{CS} falling edge. SDO comes out of 3-state and the device outputs the MSB on the \overline{CS} falling edge. The device outputs the next lower SDO bits on every SCLK falling edge after it has first seen the SCLK rising edge. The data correspond to the sample and conversion completed in the previous frame. During a \overline{CS} low period, the device converts the recently sampled signal. It uses SCLK for conversions. Conversion is complete on the 16th SCLK falling edge. \overline{CS} can be high at any time after the 16th SCLK falling edge (see the *Parameter Measurement Information* for more details). The \overline{CS} rising edge after the 16th SCLK falling edge and before the 29th SCLK falling edge keeps the device in the 16-clock data frame. The device output goes to 3-state when \overline{CS} is high. It is also permissible to stop SCLK after the device has seen the 16th SCLK falling edge.

Figure 81. ADS7945/6 Operating in 16-Clock Mode without Power-Down (PDEN = 0)

32-CLOCK FRAME

Figure 82 shows the devices operating in 32-clock mode. In this mode, the devices convert and output the data from the most recent sample before taking the next sample.

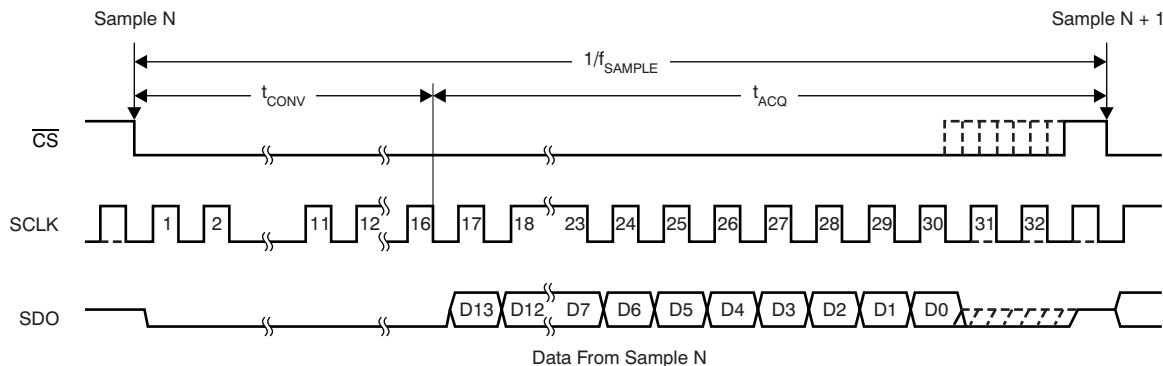

Figure 82. ADS7945/6 Operation in 32-Clock Frame without Power-Down (PDEN = 0)

\overline{CS} can be held low past the 16th falling edge of SCLK. The devices continue to output recently converted data starting with the 16th SCLK falling edge. If \overline{CS} is held low until the 30th SCLK falling edge, then the devices detect 32-clock mode. Note that the device data from recent conversions are already output with no latency before the 30th SCLK falling edge. Once 32-clock mode is detected, the device outputs 16 zeros during the next conversion (in fact, for the first 16 clocks), unlike 16-clock mode where the devices output the previous conversion result. SCLK can be stopped after the devices have seen the 30th falling edge with \overline{CS} low.

CONVERSION ABORT

For some event triggered applications such as latching position of absolute position sensor on marker or homing pulse, it is essential to abort ongoing conversion on event and quickly start fresh acquisition. ADS794X features conversion abort function. \overline{CS} high during conversion (during first 16 clocks) will abort ongoing conversion and start fresh acquisition. Device will sample acquired signal during \overline{CS} high period on falling edge of \overline{CS} and will start conversion normally, however data on SDO (conversion results from aborted frame) will not be valid.

For example if conversion is aborted during 'nth' frame and (n+1) is first valid frame after conversion abort. SDO data during frame number (n+1) (corresponding to nth conversion) will not be valid. Conversion results for sample and conversion during frame number (n+1) will be available in frame number (n+2).

POWER-DOWN

The ADS7945/6 devices offer an easy-to-use power-down feature available through a dedicated PDEN pin (pin 12). A high level on PDEN at the \overline{CS} rising edge enables the power-down mode for that particular cycle. Figure 83 to Figure 85 illustrate device operation with power-down in both 32-clock and 16-clock mode.

Many applications must slow device operation. For speeds below approximately 500 kSPS, it is convenient to use 32-clock mode with power-down. This configuration results in considerable power savings.

As shown in Figure 83, PDEN is held at a logic '1' level. Note that the device looks at the PDEN status only at the \overline{CS} rising edge; however, for continuous low-speed operation, it is convenient to continuously hold PDEN = 1. The devices detect power-down mode on the \overline{CS} rising edge with PDEN = 1.

Figure 83. Operation with a 32-Clock Frame in Power-Down Mode (PDEN = 1)

On the \overline{CS} falling edge, the devices start normal operation as previously described. The devices complete conversions on the 16th SCLK falling edge. The devices enter the power-down state immediately after

conversions complete. However, the devices can still output data as per the timings described previously. The devices consume dynamic power-down current ($I_{PD-DYNAMIC}$) during data out operations. It is recommended to stop the clock after the 32nd SCLK falling edge to further save power down to the *static power-down current* level ($I_{PD-STATIC}$). The devices power up again on the SCLK rising edge. However, they require an extra 1 μ s to power up completely. \overline{CS} must be high for the 1μ s + t_{ACQ} (min) period.

In some applications, data collection is accomplished in burst mode. The system powers down after data collection. 16-clock mode is convenient for these applications. Figure 84 and Figure 85 detail power saving in 16-clock burst mode.

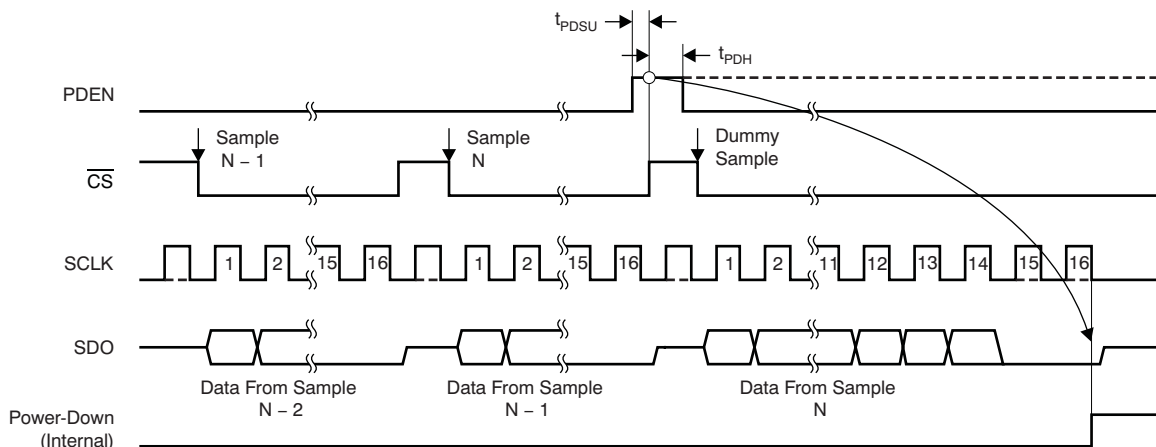

Figure 84. Entry Into Power-Down with 16-Clock Burst Mode

As shown in Figure 84, the two frames capturing the $N-1$ and N th samples are normal 16-clock frames. Keeping $\overline{\text{PDEN}} = 1$ before the $\overline{\text{CS}}$ rising edge in the next frame ensures that the devices detect the power-down mode. Data from the N th sample are read during this frame. It is expected that the N th sample represents the last data of interest in the burst of conversions. The devices enter the power-down state after the end of conversions. This is the 16th SCLK falling edge. It is recommended to stop the clock after the 16th SCLK falling edge. Note that it is mandatory not to have more than 29 SCLK falling edges during the $\overline{\text{CS}}$ low period. This limitation ensures that the devices remain in 16-clock mode.

The devices remain in a power-down state as long as $\overline{\text{CS}}$ is low. A $\overline{\text{CS}}$ rising edge with $\overline{\text{PDEN}} = 0$ brings the devices out of the power-down state. It is necessary to ensure that the $\overline{\text{CS}}$ high time for the first sample after power up is more than $1 \mu\text{s} + t_{\text{ACQ}}(\text{min})$.

Figure 85. Exit From Power-Down with 16-Clock Burst Mode

APPLICATION INFORMATION: ADS7945

The ADS7945 employs a sample-and-hold stage at the input; see [Figure 76](#) for a typical equivalent circuit of a sample-and-hold stage. The device connects a 32 pF sampling capacitor during sampling. This configuration results in a glitch at the input terminals of the device at the start of the sample. The external circuit must be designed in such a way that the input can settle to the required accuracy during the sampling time chosen. [Figure 86](#) shows a typical driving circuit for the analog inputs.

Figure 86. Typical Input Driving Circuit for the ADS7945

The 470 pF capacitor across the AINxP and AINxN terminals decouples the driving op amp from the sampling glitch. It is recommended to split the series resistance of the input filter in two equal values as shown in [Figure 86](#). It is recommended that both input terminals see the same impedance from the external circuit. The low-pass filter at the input limits noise bandwidth of the driving op amps. Select the filter bandwidth so that the full-scale step at the input can settle to the required accuracy during the sampling time. [Equation 1](#), [Equation 2](#), and [Equation 3](#) are useful for filter component selection.

$$\text{Filter Time Constant (t}_{AU}\text{)} = \frac{\text{Sampling Time}}{\text{Settling Resolution} \times \ln(2)}$$

Where:

Settling resolution is the accuracy in LSB to which the input needs to settle. A typical settling resolution for the 14-bit device is 15 or 16. (1)

$$\text{Filter Time Constant (t}_{AU}\text{)} = R \times C \quad (2)$$

$$\text{Filter Bandwidth} = \frac{1}{2 \times \pi \times t_{AU}} \quad (3)$$

Also, make sure the driving op amp bandwidth does not limit the signal bandwidth below filter bandwidth. In many applications, signal bandwidth may be much lower than filter bandwidth. In this case, an additional low-pass filter may be used at the input of the driving op amp. This signal filter bandwidth can be selected in accordance with the input signal bandwidth.

INPUT COMMON-MODE RANGE

The AIN+ and AIN– inputs to the ADS7945 should typically vary between 0 V and V_{REF} with a common-mode of $V_{REF}/2$. The ADS7945 offers excellent CMRR which makes it possible to achieve close to the rated performance of the converter even in cases where the common-mode input is not well-controlled. The device can accept a ± 200 mV variation in the common-mode voltage at any V_{DD}/V_{REF} combination allowing use of the entire ADC signal range ($-V_{REF}$ to $+V_{REF}$ differentially).

DRIVING AN ADC WITHOUT A DRIVING OP AMP

For some low input signal bandwidth applications, such as battery power monitoring or mains monitoring, it is not required to operate an ADC at high sampling rates. In fact, it is desirable to avoid using a driving op amp from a cost perspective. In these cases, the ADC input sees the impedance of the signal source (such as a battery or mains transformer). This section elaborates the effects of source impedance on sampling frequency.

Equation 1 can be rewritten as Equation 4:

$$\text{Sampling Time} = \text{Filter Time Constant} \times \text{Settling Resolution} \times \ln(2) \quad (4)$$

As shown in Figure 87, it is recommended to use a bypass capacitor across the positive and negative ADC input terminals.

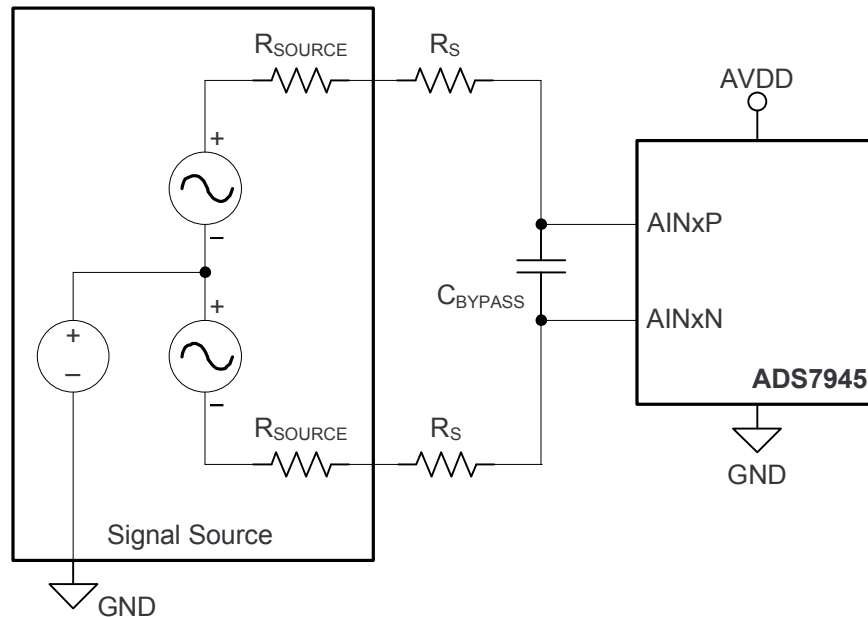

Figure 87. Driving an ADS7945 ADC Without a Driving Op Amp

Source impedance ($2 \times R_{\text{SOURCE}} + 2 \times R_S$) with ($C_{\text{BYPASS}} + C_{\text{SAMPLE}}$) acts as a low-pass filter with Equation 5:

$$\text{Filter Time Constant} = 2 \times (R_{\text{SOURCE}} + R_S) \times (C_{\text{BYPASS}} + C_{\text{SAMPLE}})$$

where:

C_{SAMPLE} is the internal sampling capacitance of the ADC (equal to 32 pF). (5)

Table 4 lists the recommended bypass capacitor values and the filter time constant for different source resistances. It is recommended to use a 10 pF bypass capacitor, at minimum. Table 4 assumes $R_S = 5\ \Omega$; however, depending on the application, R_S can be chosen to be $0\ \Omega$. In this case, there is an extra margin of $5\ \Omega$ for R_{SOURCE} .

Table 4. Filter Time Constant versus Source Resistance

| $2 \times R_{SOURCE}\ (\Omega)$ | $2 \times (R_{SOURCE} + R_S)$ | APPROXIMATE C_{BYPASS} (pF) | $C_{BYPASS} + C_{SAMPLE}$ (pF) | FILTER TIME CONSTANT (ns) |
|---------------------------------|-------------------------------|----------------------------------|--------------------------------|------------------------------|
| 18 | 28 | 220 | 252 | 7.2 |
| 44 | 54 | 100 | 132 | 7.2 |
| 81 | 91 | 47 | 79 | 7.2 |
| 161 | 171 | 10 | 42 | 7.2 |
| 500 | 510 | 10 | 42 | 21 |
| 1000 | 1010 | 10 | 42 | 42 |
| 5000 | 5010 | 10 | 42 | 210 |

Typically, settling resolution is selected as (ADC resolution + 2). For the ADS7945 (14-bit) the ideal settling resolution is 16. Using Equation 2 and Equation 3, the sampling time can be easily determined for a given source impedance and allows 80 ns of sampling time for a 14-bit ADC with 7.2 ns of filter time constant, which matches the ADS7945 specifications. For net source impedance ($2 \times (R_{SOURCE} + R_S)$) above 171 Ω , the filter time constant continues to increase beyond the 7.2 ns required for an 80 ns sampling time. This increment increases the minimum permissible sampling time for 14-bit settling and the device must be operated at a lower sampling rate.

The device sampling rate can be maximized by using a 40 MHz clock even for lower throughputs. Table 5 shows typical calculations for the ADS7945.

Table 5. Sampling Frequency versus Source Impedance for the ADS7945 (14-Bit)

| $2 \times R_{SOURCE}\ (\Omega)$ | C_{BYPASS} (pF) | SAMPLING TIME, t_{ACQ} (ns) | CONVERSION TIME, t_{CONV} (ns) | CYCLE TIME, $t_{ACQ} +$ t_{CONV} (ns) | SAMPLING RATE (MSPS) |
|---------------------------------|-------------------|----------------------------------|-------------------------------------|--|-------------------------|
| 161 | 10 | 80 | 420 (with 40 MHz clock) | 500 | 2 |
| 500 | 10 | 235 | 420 (with 40 MHz clock) | 655 | 1.5 |
| 1000 | 10 | 468 | 420 (with 40 MHz clock) | 888 | 1.1 |
| 5000 | 10 | 2331 | 420 (with 40 MHz clock) | 2751 | 0.4 |

It is necessary to allow 1000 ns additional sampling time over what is shown in Table 5 if PDEN (pin 12) is set high.

APPLICATION INFORMATION: ADS7946

The ADS7946 employs a sample-and-hold stage at the input; see [Figure 76](#) for a typical equivalent circuit of a sample-and-hold stage. The device connects a 32 pF sampling capacitor during sampling. This configuration results in a glitch at the input terminals of the device at the start of the sample. The external circuit must be designed in such a way that the input can settle to the required accuracy during the sampling time chosen. [Figure 88](#) shows a typical driving circuit for the analog inputs.

Figure 88. Typical Input Driving Circuit For the ADS7946

The 470 pF capacitor across the AINx and AINxGND terminals decouples the driving op amp from the sampling glitch. It is recommended to split the series resistance of the input filter in two equal values, as shown in [Figure 88](#). It is recommended that both input terminals see the same impedance from the external circuit. The low-pass filter at the input limits noise bandwidth of the driving op amp. Select the filter bandwidth so that the full-scale step at the input can settle to the required accuracy during the sampling time. [Equation 6](#), [Equation 7](#), and [Equation 8](#) are useful for filter component selection.

$$\text{Filter Time Constant (t}_{AU}) = \frac{\text{Sampling Time}}{\text{Settling Resolution} \times \ln(2)}$$

where:

Settling resolution is the accuracy in LSB to which the input must settle. A typical settling resolution for the 14-bit device is 15 or 16. (6)

$$\text{Filter Time Constant (t}_{AU}) = R \times C \quad (7)$$

$$\text{Filter Bandwidth} = \frac{1}{2 \times \pi \times t_{AU}} \quad (8)$$

Also, make sure the driving op amp bandwidth does not limit the signal bandwidth below filter bandwidth. In many applications, signal bandwidth may be much lower than filter bandwidth. In this case, an additional low-pass filter may be used at the input of the driving op amp. This signal filter bandwidth can be selected in accordance with the input signal bandwidth.

DRIVING AN ADC WITHOUT A DRIVING OP AMP

For some low input signal bandwidth applications, such as battery power monitoring or mains monitoring, it is not required to operate an ADC at high sampling rates. In fact, it is desirable to avoid using a driving op amp from a cost perspective. In this case, the ADC input sees the impedance of the signal [Equation 4](#) source (such as a battery or mains transformer). This section elaborates the effects of source impedance on sampling frequency.

[Equation 6](#) can be rewritten as [Equation 9](#):

$$\text{Sampling Time} = \text{Filter Time Constant} \times \text{Settling Resolution} \times \ln(2) \quad (9)$$

As shown in [Figure 89](#), it is recommended to use a bypass capacitor across the positive and negative ADC input terminals.

Figure 89. Driving an ADS7946 ADC Without a Driving Op Amp

Source impedance ($R_{SOURCE} + R_S$) with ($C_{BYPASS} + C_{SAMPLE}$) acts as a low-pass filter with [Equation 10](#):

$$\text{Filter Time Constant} = (R_{SOURCE} + R_S) \times (C_{BYPASS} + C_{SAMPLE})$$

Where:

C_{SAMPLE} is the internal sampling capacitance of the ADC (equal to 32 pF). (10)

Table 6 lists the recommended bypass capacitor values and the filter time constant for different source resistances. It is recommended to use a 10 pF bypass capacitor (minimum).

Table 6. Filter Time Constant versus Source Resistance

| $R_{SOURCE} (\Omega)$ | $R_{SOURCE} + R_S$ | APPROXIMATE C_{BYPASS} (pF) | $C_{BYPASS} + C_{SAMPLE}$ (pF) | FILTER TIME CONSTANT (ns) |
|-----------------------|--------------------|----------------------------------|--------------------------------|------------------------------|
| 23 | 28 | 220 | 252 | 7.2 |
| 49 | 54 | 100 | 132 | 7.2 |
| 86 | 91 | 47 | 79 | 7.2 |
| 166 | 171 | 10 | 42 | 7.2 |
| 500 | 505 | 10 | 42 | 21 |
| 1000 | 1005 | 10 | 42 | 42 |
| 5000 | 5005 | 10 | 42 | 210 |

Typically, settling resolution is selected as (ADC resolution + 2). For the ADS7946 (14-bit) the ideal settling resolution is 16. Using equations Equation 7 and Equation 8, the sampling time can be easily determined for a given source impedance and allows 80 ns of sampling time for a 14-bit ADC with 7.2 ns of filter time constant, which matches the ADS7946 specifications. For source impedance above 166 Ω , the filter time constant continues to increase beyond the 7.2 ns required for an 80 ns sampling time. This increment increases the minimum permissible sampling time for 14-bit settling and the device must be operated at a lower sampling rate.

The device sampling rate can be maximized by using a 40 MHz clock even for lower throughputs. Table 7 shows typical calculations for the ADS7946.

Table 7. Sampling Frequency versus Source Impedance for the ADS7946 (14-Bit)

| $R_{SOURCE} (\Omega)$ | C_{BYPASS} (pF) | SAMPLING TIME, t_{ACQ} (ns) | CONVERSION TIME, t_{CONV} (ns) | CYCLE TIME, $t_{ACQ} +$ t_{CONV} (ns) | SAMPLING RATE (MSPS) |
|-----------------------|-------------------|----------------------------------|-------------------------------------|--|-------------------------|
| 166 | 10 | 80 | 420 (with 40 MHz clock) | 500 | 2 |
| 500 | 10 | 235 | 420 (with 40 MHz clock) | 655 | 1.5 |
| 1000 | 10 | 468 | 420 (with 40 MHz clock) | 888 | 1.1 |
| 5000 | 10 | 2331 | 420 (with 40 MHz clock) | 2751 | 0.4 |

It is necessary to allow 1000 ns additional sampling time over what is shown in Table 7 if PDEN (pin 12) is set high.

PCB LAYOUT/SCHEMATIC GUIDELINES: ADS7945

The ADS7945 is a mixed-signal device. For maximum performance, proper decoupling, grounding, and proper termination of digital signals are essential. [Figure 90](#) shows the essential components around the ADC. All capacitors shown are ceramic. These decoupling capacitors must be placed close to the respective signal pins.

There is a 47 Ω *source series termination* resistor shown on the SDO signal. This resistor must be placed as close to pin 15 as possible. Series terminations for SCLK and \overline{CS} must be placed close to the host.

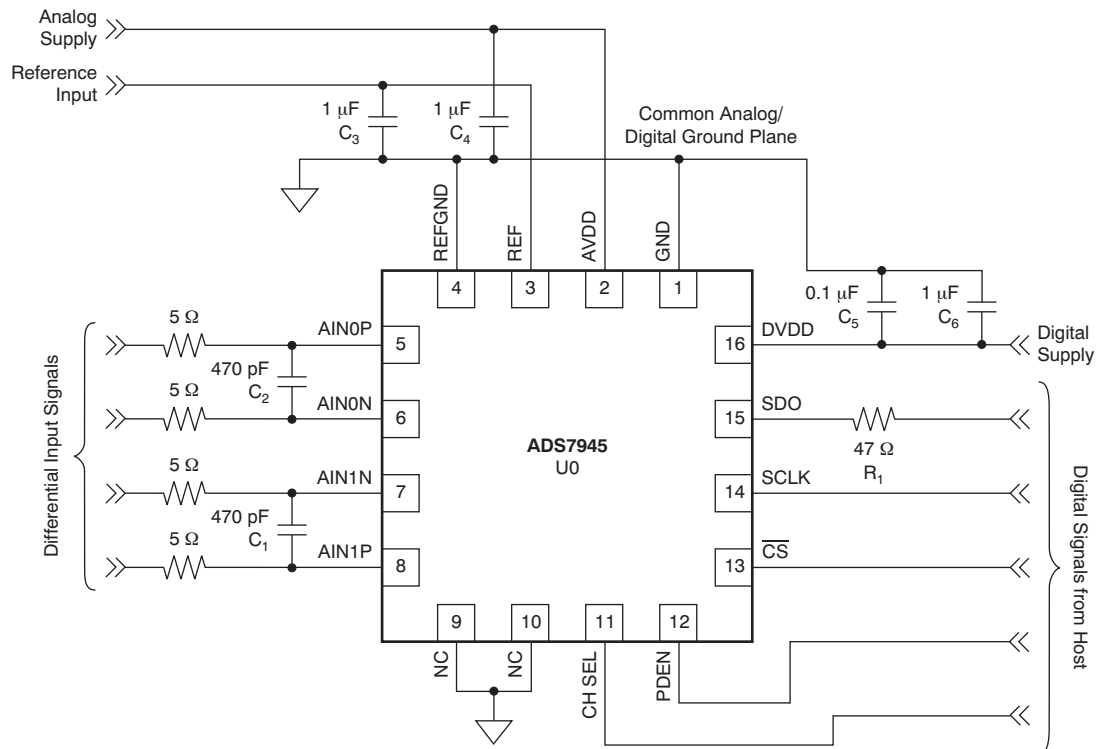

Figure 90. Recommended ADS7945 ADC Schematic

A common ground plane for both analog and digital often enables better results. Typically, the second PCB layer is the ground plane. The ADC ground pins are returned to the ground plane through multiple vias (PTH). It is a good practice to place analog components on one side and digital components on other side of the ADC (or ADCs). All signals must be routed, assuming there is a split ground plane for analog and digital. Furthermore, it is better to split the ground initially during layout. Route all analog and digital traces so that the traces see the respective ground all along the second layer. Then short both grounds to form a common ground plane. [Figure 91](#) shows a typical layout around the ADC.

Figure 91. Recommended ADS7945 ADC Layout
(Only top layer is shown; second layer is common ground for analog and digital)

PCB LAYOUT/SCHEMATIC GUIDELINES: ADS7946

The ADS7946 is a mixed-signal device. For maximum performance, proper decoupling, grounding, and proper termination of digital signals are essential. Figure 92 shows the essential components around the ADC. All capacitors shown are ceramic. These decoupling capacitors must be placed close to the respective signal pins.

There is a $47\ \Omega$ source series termination resistor shown on the SDO signal. This resistor must be placed as close to pin 15 as possible. Series terminations for SCLK and $\overline{\text{CS}}$ must be placed close to the host.

Figure 92. Recommended ADS7946 ADC Schematic

A common ground plane for both analog and digital often enables better results. Typically, the second PCB layer is the ground plane. The ADC ground pins are returned to the ground plane through multiple vias (PTH). It is a good practice to place analog components on one side and digital components on other side of the ADC (or ADCs). All signals must be routed, assuming there is a split ground plane for analog and digital. Furthermore, it is better to split the ground initially during layout. Route all analog and digital traces so that the traces see the respective ground all along the second layer. Then short both grounds to form a common ground plane. [Figure 93](#) shows a typical layout around the ADC.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION
REEL DIMENSIONS

TAPE DIMENSIONS

| | |
|----|---|
| A0 | Dimension designed to accommodate the component width |
| B0 | Dimension designed to accommodate the component length |
| K0 | Dimension designed to accommodate the component thickness |
| W | Overall width of the carrier tape |
| P1 | Pitch between successive cavity centers |

MECHANICAL DATA

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

4205254/D 01/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Falls within JEDEC MO-220.

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206446-8/U 08/15

NOTE: A. All linear dimensions are in millimeters

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
