

ADS7128 小型 8 通道 12 位 ADC，具有 I²C 接口、GPIO 和 CRC

1 特性

- 小封装尺寸：
 - 3mm × 3mm WQFN
- 8 通道，可配置为以下任意组合：
 - 最多 8 个模拟输入、数字输入或数字输出
- 用于 I/O 扩展的 GPIO：
 - 开漏、推挽数字输出
- 模拟监控：
 - 每个通道的可编程阈值
 - 用于瞬态抑制的事件计数器
- 宽工作范围：
 - AVDD: 2.35V 至 5.5V
 - DVDD: 1.65V 至 5.5V
 - 温度范围: -40°C 至 +85°C
- 用于读取/写入操作的 CRC：
 - 数据读取/写入 CRC
 - 上电配置 CRC
- I²C 接口：
 - 高达 3.4MHz（高速）
 - 8 个可配置 I²C 地址
- 可编程均值滤波器
- 均方根模块：
 - 16 位真正 RMS 输出
 - 可编程 RMS 时间窗口
- 过零检测模块：
 - 对应于任何模拟输入的 ZCD 输出
 - 内置瞬态抑制和迟滞

– 数字可调节检测阈值

2 应用

- 监控功能
- 便携式仪表
- 电器
- 电信基础设施
- 电源监控

3 说明

ADS7128 是一款易于使用的 8 通道多路复用 12 位逐次逼近寄存器模数转换器 (SAR ADC)。8 个通道可独立配置为模拟输入、数字输入或数字输出。该器件具有一个用于执行 ADC 转换过程的内部振荡器。

ADS7128 通过兼容 I²C 的接口进行通信，可以在自主或单冲转换模式下运行。ADS7128 使用具有可编程高低阈值、迟滞和事件计数器的数字窗口比较器，通过每通道事件触发的中断来实施模拟监控功能。ADS7128 具有用于数据读取/写入操作和上电配置的内置循环冗余校验 (CRC) 功能。ADS7128 具有一个均方根 (RMS) 模块，可以为任何模拟输入通道计算 16 位真正 RMS 结果。集成式过零检测 (ZCD) 模块可以在接近超过可配置阈值时触发瞬态抑制和迟滞。

8 Detailed Description

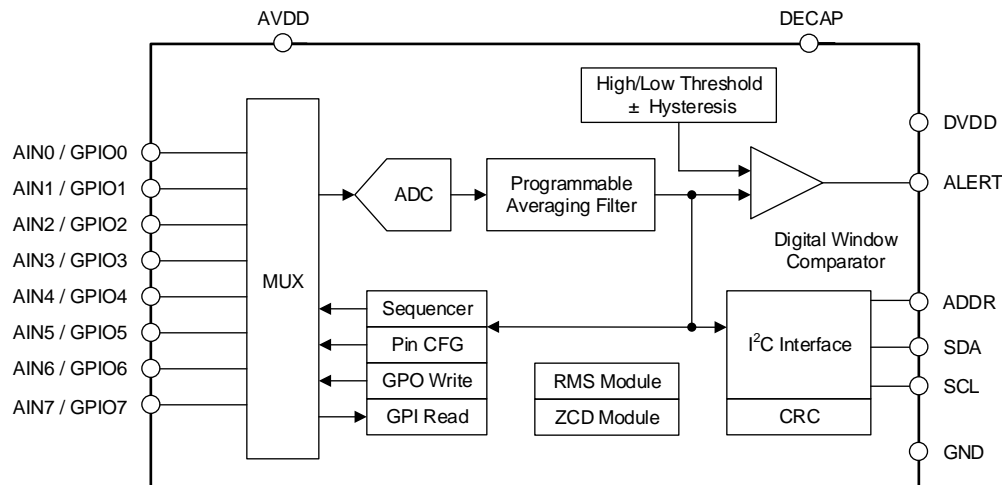

8.1 Overview

The ADS7128 is a small, eight-channel, multiplexed, 12-bit, analog-to-digital converter (ADC) with an I²C-compatible serial interface. The eight channels of the ADS7128 can be individually configured as either analog inputs, digital inputs, or digital outputs. The device includes a digital comparator with a dedicated alert pin that can be used to interrupt the host when a programmed high or low threshold is crossed on any input channel. The device uses an internal oscillator for conversion. The ADC can be used in the manual mode for reading ADC data over the I²C interface or in autonomous mode for monitoring the analog inputs without an active I²C interface.

The device features a programmable averaging filter that outputs a 16-bit result for enhanced resolution. The root-mean-square (RMS) module computes a 16-bit true RMS result of any analog input channel over a configurable time window. The zero-crossing-detect (ZCD) module can be used to generate a digital output corresponding to the programmable threshold crossings of any analog input channel.

The I²C serial interface supports standard-mode, fast-mode, fast-mode plus, and high-speed mode. The device also features an 8-bit cyclic redundancy check (CRC) for the serial communication interface.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Multiplexer and ADC

The eight channels of the multiplexer can be independently configured as ADC inputs or general-purpose inputs/outputs (GPIOs). 图 2 shows that each input pin has electrostatic discharge (ESD) protection diodes to AVDD and GND. On power-up or after device reset, all eight multiplexer channels are configured as analog inputs.

图 2 shows an equivalent circuit for pins configured as analog inputs. The ADC sampling switch is represented by an ideal switch (SW) in series with the resistor, R_{SW} (typically 150 Ω), and the sampling capacitor, C_{SH} (typically 12 pF).

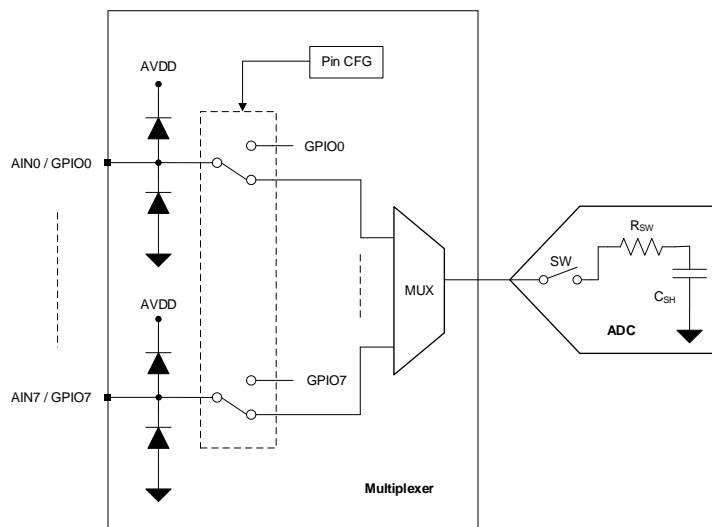

图 2. Analog Inputs, GPIOs, and ADC Connections

During acquisition, the SW switch is closed to allow the signal on the selected analog input channel to charge the internal sampling capacitor. During conversion, the SW switch is opened to disconnect the analog input channel from the sampling capacitor.

The multiplexer channels can be configured as GPIOs in the PIN_CFG register. The direction of a GPIO (either as an input or an output) can be set in the GPIO_CFG register. The logic level on the channels configured as digital inputs can be read from the GPI_VALUE register. The digital outputs can be accessed by writing to the GPO_OUTPUT_VALUE register. The digital outputs can be configured as either open-drain or push-pull in the GPO_DRIVE_CFG register.

8.3.2 Reference

The device uses the analog supply voltage (AVDD) as a reference for the analog-to-digital conversion process. TI recommends connecting a 1- μ F, low-equivalent series resistance (ESR) ceramic decoupling capacitor between the AVDD and GND pins.

8.3.3 ADC Transfer Function

The ADC output is in straight binary format. 公式 1 computes the ADC resolution:

$$1 \text{ LSB} = V_{REF} / 2^N$$

where:

- $V_{REF} = AVDD$
- $N = 12$

(1)

图 3 和 表 1 detail the transfer characteristics for the device.

$\geq AVDD - 1 \text{ LSB}$	PFSC	Positive full-scale code	FFF

8.3.4 ADC Offset Calibration

The variation in ADC offset error resulting from changes in temperature or AVDD can be calibrated by setting the CAL bit in the GENERAL_CFG register. The CAL bit is reset to 0 after calibration. The host can poll the CAL bit to check the ADC offset calibration completion status.

8.3.5 I²C Address Selector

The I²C address for the device is determined by connecting external resistors on the ADDR pin. The device address is determined at power-up based on the resistor values. The device retains this address until the next power-up event, until the next device reset, or until the device receives a command to program its own address. 图 4 shows a connection diagram for the ADDR pin and 表 2 lists the resistor values for selecting different addresses of the device.

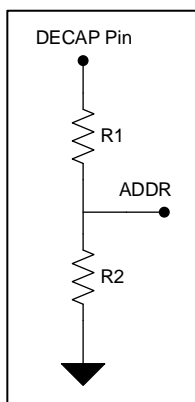

图 4. External Resistor Connection Diagram for the ADDR Pin

表 2. I²C Address Selection

DNP ⁽²⁾	100 kΩ	001 0011b (13h)

(1) Tolerance for R1, R2 ≤ ±5%.

(2) DNP = Do not populate.

8.3.6 Programmable Averaging Filter

The ADS7128 features a built-in oversampling (OSR) function that can be used to average several samples. The averaging filter can be enabled by programming the OSR[2:0] bits in the OSR_CFG register. The averaging filter configuration is common to all analog input channels. 图 5 shows that the averaging filter module output is 16 bits long. In the manual conversion mode and auto-sequence mode, only the first conversion for the selected analog input channel must be initiated by the host; see the [Manual Mode](#) and [Auto-Sequence Mode](#) sections. As shown in 图 5, any remaining conversions for the selected averaging factor are generated internally. The time required to complete the averaging operation is determined by the sampling speed and number of samples to be averaged. As shown in 图 5, the 16-bit result can be read out after the averaging operation completes.

图 5. Averaging Example

In 图 5, SCL is stretched by the device after the start of conversions until the averaging operation is complete.

If SCL stretching is not required during averaging, enable the statistics registers by setting STATS_EN to 1b and initiate conversions by writing 1b to the CNVST bit. The OSR_DONE bit in the SYSTEM_STATUS register can be polled to check the averaging completion status. When using the CNVST bit to initiate conversion, the result can be read in the RECENT_CHx_LSB and RECENT_CHx_MSB registers.

In the autonomous mode of operation, samples from the analog input channels that are enabled in the AUTO_SEQ_CH_SEL register are averaged sequentially; see the [Autonomous Mode](#) section. The digital window comparator compares the top 12 bits of the 16-bit average result with the thresholds.

公式 2 provides the LSB value of the 16-bit average result.

$$1 \text{ LSB} = \frac{AVDD}{2^{16}} \quad (2)$$

8.3.7 CRC on Data Interface

The ADS7128 features a cyclic redundancy check (CRC) module for checking the integrity of the data bits exchanged over the I²C interface. The CRC module is bidirectional and appends an 8-bit CRC to every byte read from the device while also evaluating the CRC of every incoming byte over the I²C interface. The CRC module uses the CRC-8-CCITT polynomial ($x^8 + x^2 + x + 1$) for CRC computation.

To enable the CRC module, set the CRC_EN bit in the GENERAL_CFG register. 表 3 shows how a CRC error can be detected when configuring the ADS7128.

表 3. Configuration Notifications When a CRC Error is Detected

CRC ERROR NOTIFICATION	CONFIGURATION	DESCRIPTION
ALERT pin	ALERT_CRCIN = 1b	ALERT pin is asserted if a CRC error is detected by the device.
Status flags	APPEND_STATUS = 10b	4-bit status flags are appended to the ADC data; see the Output Data Format section for details.
Register read	—	Read the CRC_ERR_IN bit to check if a CRC error is detected.

When the ADS7128 detects a CRC error, the erroneous data are ignored and the CRC_ERR_IN bit is set. 表 3 describes the additional notifications that can be enabled. Further register writes are disabled until the CRC_ERR_IN bit is cleared by writing 1b to it. When using autonomous mode, further conversions can be disabled on the CRC error by setting CONV_ON_ERR to 1b; see the [Autonomous Mode](#) section.

8.3.8 General-Purpose I/Os (GPIOs)

The eight channels of the ADS7128 can be independently configured as analog inputs, digital inputs, or digital outputs. 表 4 describes how the PIN_CFG and GPIO_CFG registers can be used to configure the channels.

表 4. Configuring Channels as Analog Inputs or GPIOs

PIN_CFG[7:0]	GPIO_CFG[7:0]		GPO_DRIVE_CFG[7:0]	CHANNEL CONFIGURATION
0	x		x	Analog input (default)
1	0		x	Digital input
1	1		0	Digital output; open-drain driver
1	1		1	Digital output; push-pull driver

The digital outputs can be configured to logic 1 or 0 by writing to the GPO_OUTPUT_VALUE register. Reading the GPI_VALUE register returns the logic level for all channels configured as digital inputs.

8.3.9 Oscillator and Timing Control

The device uses an internal oscillator for conversions. When using the averaging module or the RMS module, the host initiates the first conversion and all subsequent conversions are generated internally by the device. However, in the autonomous mode of operation, the start of the conversion signal is generated by the device. 表 5 shows that when the device generates the start of the conversion, the sampling rate is controlled by the OSC_SEL and CLK_DIV[3:0] register fields.

表 5. Configuring Sampling Rate for Internal Conversion Start Control

CLK_DIV[3:0]	OSC_SEL = 0		OSC_SEL = 1	
	SAMPLING FREQUENCY, f_{CYCLE} (kSPS)	CYCLE TIME, t_{CYCLE} (μs)	SAMPLING FREQUENCY, f_{CYCLE} (kSPS)	CYCLE TIME, t_{CYCLE} (μs)
0000b	1000	1	31.25	32
0001b	666.7	1.5	20.83	48
0010b	500	2	15.63	64
0011b	333.3	3	10.42	96
0100b	250	4	7.81	128
0101b	166.7	6	5.21	192
0110b	125	8	3.91	256
0111b	83	12	2.60	384
1000b	62.5	16	1.95	512
1001b	41.7	24	1.3	768
1010b	31.3	32	0.98	1024
1011b	20.8	48	0.65	1536
1100b	15.6	64	0.49	2048
1101b	10.4	96	0.33	3072

The conversion time of the device (see t_{CONV} in the [Switching Characteristics](#) table) is independent of the OSC_SEL and CLK_DIV[3:0] configuration.

8.3.10 Output Data Format

图 6 illustrates various I²C frames for reading data.

- Read the ADC conversion result: Two 8-bit I²C packets are required (frame A).
- Read the averaged conversion result: Two 8-bit I²C packets are required (frame B).
- Read data with the channel ID or status flags appended: The 4-bit channel ID or status flags can be appended to the 12-bit ADC result by configuring the APPEND_STATUS field in the GENERAL_CFG register. The status flags can be used to detect if a CRC error is detected and if an alert condition is detected by the digital window comparator. When the channel ID or status flags are appended to the 12-bit ADC data, two I²C packets are required (frame C). If the channel ID or status flags are appended to the 16-bit average result, three I²C frames are required (frame D).

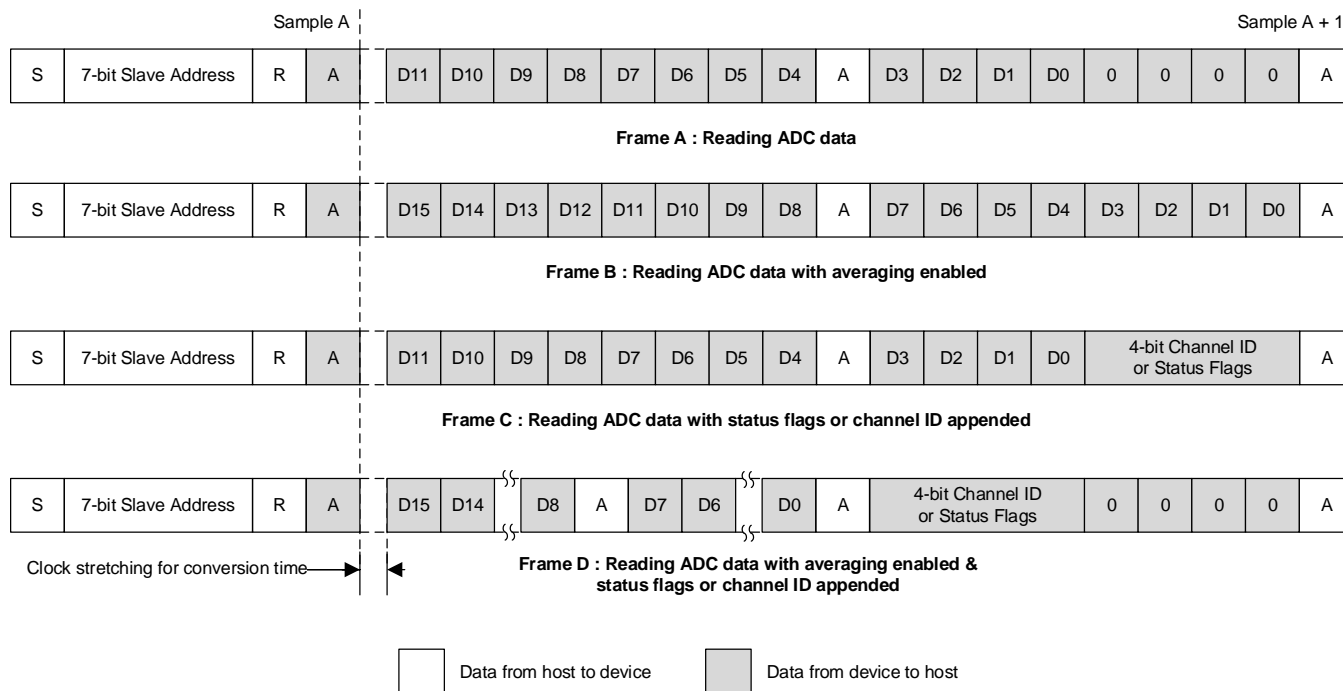

图 6. Data Frames for Reading Data

When status flags are enabled, APPEND_STATUS is set to 10b and four bits are appended to the ADC output. The device outputs status flags in this order: {1b, 0b, CRCERR_IN, ALERT}. The level transitions on the digital interface, resulting from the fixed 1b and 0b in the status flags, can be used to detect if the digital outputs are shorted to a fixed voltage in the system. The CRCERR_IN flag reflects the corresponding bit in the GENERAL_CFG register. The ALERT flag is the output of the logical OR of the bits in the EVENT_FLAG register.

8.3.11 Digital Window Comparator

The internal digital window comparator (DWC) is available in all functional modes of the device (see the [Device Functional Modes](#) section for details). The digital window comparator controls output of the ALERT pin buffer. The ALERT pin can be configured as open-drain (default) or push-pull output using the ALERT_DRIVE bit in the ALERT_PIN_CFG register. 图 7 shows a block diagram for the digital window comparator.

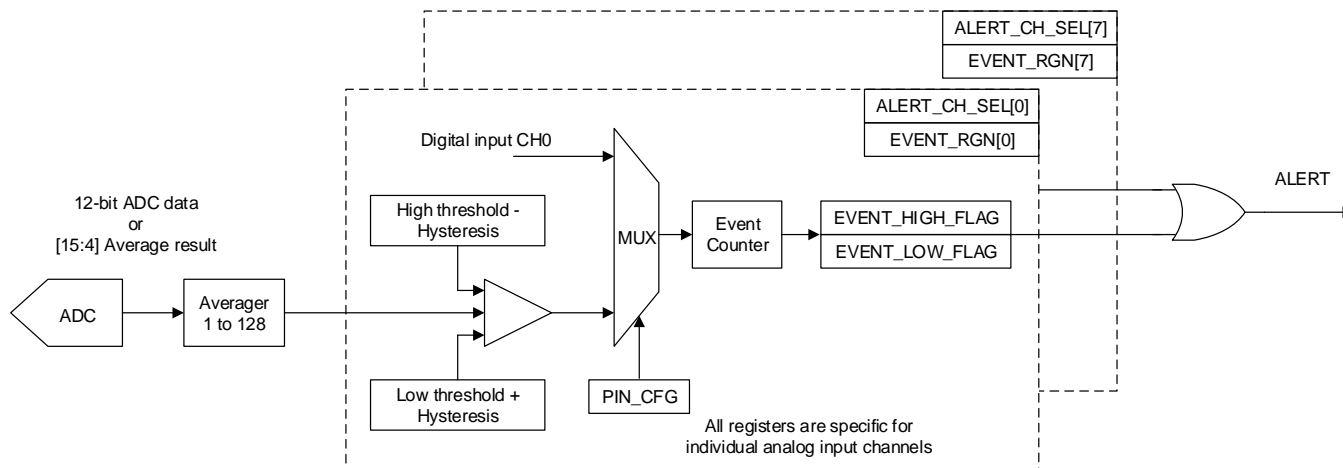

图 7. Digital Window Comparator Block Diagram

The low-side threshold, high-side threshold, event counter, and hysteresis parameters are independently programmable for each input channel. 图 8 shows the events that can be monitored for every analog input channel by the window comparator.

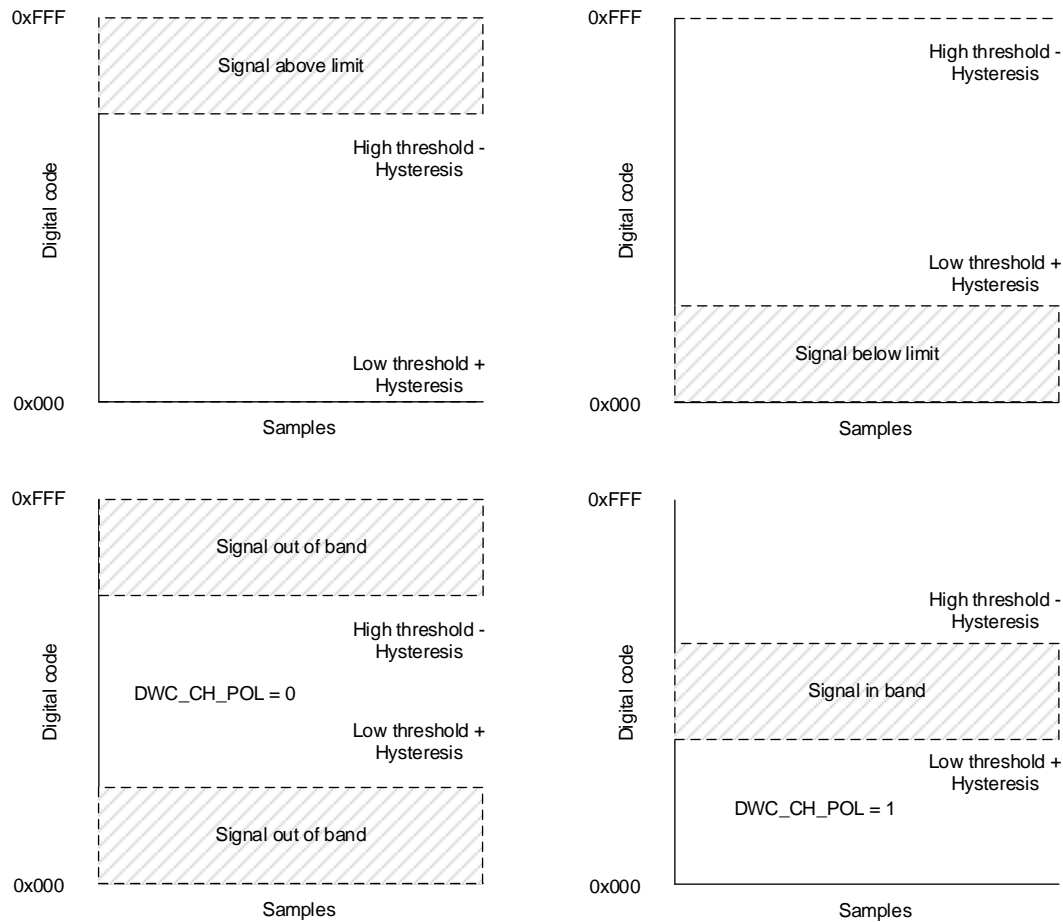

图 8. Event Monitoring With the Window Comparator

To enable the digital window comparator, set the `DWC_EN` bit in the `GENERAL_CFG` register. By default, hysteresis is 0, the high threshold is 0xFFFF, and the low threshold is 0x000. A 12-bit straight binary code cannot be higher than 0xFFFF or lower than 0x000, thus the thresholds have no effect unless set to different values. 图 8 shows the various types of event that can be detected by adjusting the thresholds. For detecting when a signal is in-band, the `EVENT_RGN` register must be configured. In each of the cases shown in 图 8, either or both `EVENT_HIGH_FLAG` and `EVENT_LOW_FLAG` can be set.

The programmable event counter counts consecutive thresholds violations before alert flags can be set. The event count can be set to a higher value to avoid transients in the input signal setting the alert flags.

In order to assert the `ALERT` pin when the alert flag is set for a particular analog input channel, set the corresponding bit in the `ALERT_CH_SEL` register. Alert flags are set regardless of the `ALERT_CH_SEL` configuration if `DWC_EN` is 1 and the high or low thresholds are exceeded.

8.3.11.1 Interrupts From Digital Inputs

Logic 1 or logic 0 events can be detected on channels configured as digital inputs, as shown in 表 6, by enabling the corresponding ALERT_CH_SEL bit.

表 6. Configuring Interrupts From Digital Inputs

PIN_CFG[7:0]	GPIO_CFG[7:0]	ALERT_CH_SEL[7:0]	EVENT_RGN [7:0]	EVENT DESCRIPTION

1	0	1	1	EVENT_LOW_FLAG is set when digital input channel is at logic 0.

8.3.11.2 Changing Digital Outputs on Alert and ZCD

图 9 shows how digital outputs can be updated in response to alerts from individual channels or synchronized to the zero-crossing-detect signal.

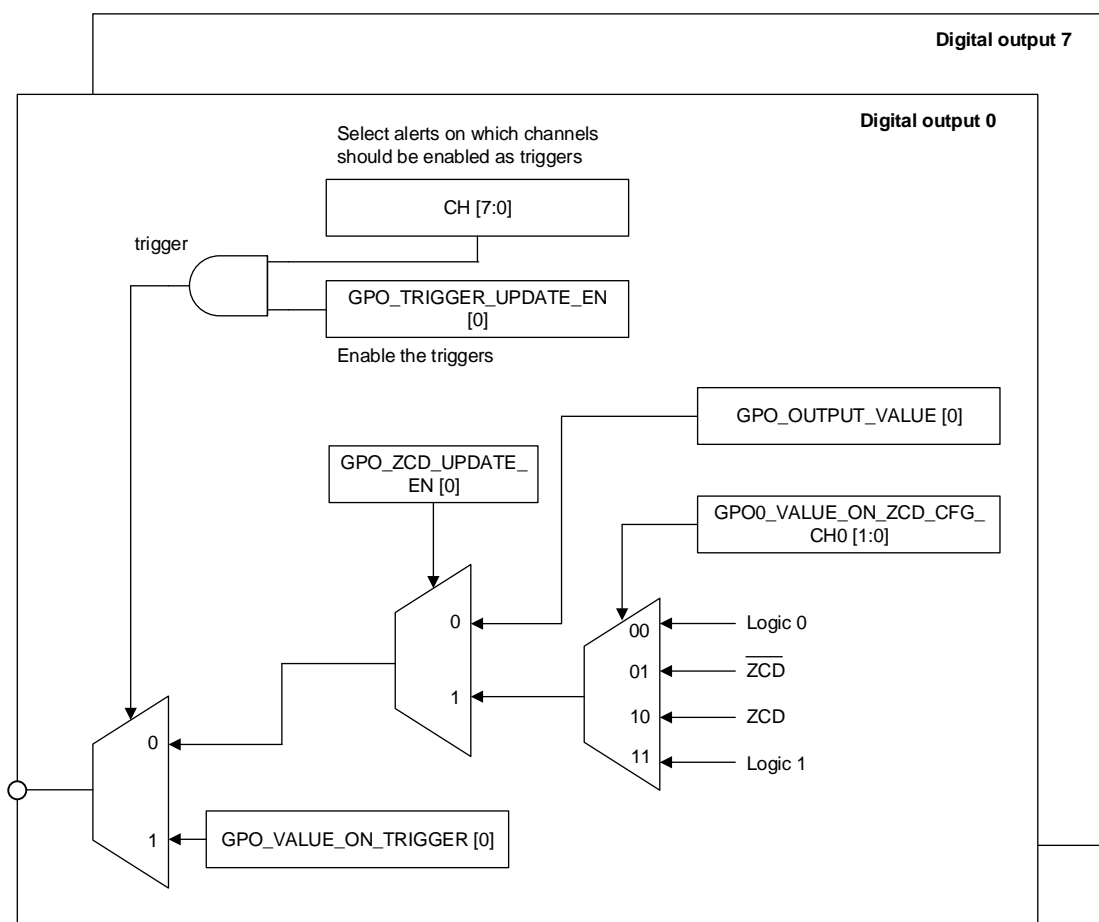

图 9. Block Diagram for the Digital Output Logic

8.3.11.2.1 Changing Digital Outputs on Alerts

Any given digital output can be updated in response to an alert condition on one or more analog inputs and digital inputs. To update the digital output in response to alert conditions, the trigger must be configured and the value must be launched on the trigger.

8.3.11.2.1.1 Trigger

The following events can act as triggers for updating the value on the digital output:

- An alert occurs on one or more analog input channels. The digital window comparator must be enabled for these channels.
- An alert occurs on one or more digital input channels. The digital window comparator must be enabled for these channels.

Configure the GPOx_TRIG_EVENT_SEL register to select which channels, analog inputs, or digital inputs can trigger an update on the digital output pin. After configuring the triggers for updating a digital output, the logic can be enabled by configuring the corresponding bit in the GPO_TRIGGER_UPDATE_EN register.

8.3.11.2.1.2 Output Value

The digital outputs can be set to logic 1 or logic 0 in response to the triggers. The value to be updated on the digital output when a trigger event occurs can be configured in the GPO_VALUE_ON_TRIGGER register.

8.3.11.2.2 Changing Digital Outputs Synchronous to the Zero-Crossing Detect

Individual digital outputs can be set to either logic 0, logic 1, ZCD, or $\overline{\text{ZCD}}$ synchronous to the zero-crossing-detect signal. This function can be enabled for individual digital outputs by configuring the GPO_VALUE_ON_ZCD_CFG_CHx field and setting the corresponding bit in the GPO_ZCD_UPDATE_EN [7:0] register.

8.3.12 Root-Mean-Square Module

The ADS7128 features an RMS computation module. Any one analog input channel can be selected for computing the RMS result. The RMS result is computed over a block of samples from the selected channel and the result can be read from the RMS_RESULT_LSB and RMS_RESULT_MSB registers. 公式 3 shows how the RMS result is computed by calculating the 16-bit square root of the mean of the accumulated result of the squares of the ADC conversion data.

$$RMS = \sqrt{\underbrace{\left(\frac{D_1^2 + D_2^2 + D_3^2 + \dots + D_N^2}{N} \right)}_{\text{AC component}} - b \times \underbrace{\left(\frac{D_1 + D_2 + D_3 + \dots + D_N}{N} \right)^2}_{\text{DC component}}} \text{ LSB}$$

where

- D is the data corresponding to the analog input channel selected for RMS measurement
- N is the number of samples over which the RMS is computed

The DC offset must be subtracted from the AC component because the analog input signal to the ADC is unipolar. DC subtraction can be enabled or disabled, as given by b in 公式 3, by configuring the DC_SUB field. The RMS result is 16 bits long and 公式 4 gives the size of the 1 LSB of RMS result.

$$1 \text{ LSB} = AVDD / 2^{16} \quad (4)$$

The procedure for using the RMS module is outlined in the steps below:

1. Select the channel for the RMS computation using the RMS_CHID field in the RMS_CFG register.
2. Define the time over which the RMS is to be computed by configuring the RMS_SAMPLES field.
3. Start the RMS computation by setting RMS_EN to 1 in the GENERAL_CFG register.
4. The device starts computing the RMS result when the sample size defined by RMS_SAMPLES is converted on the analog input selected for RMS computation. An additional 40 samples must be converted to complete the RMS computation.
5. To monitor for when the RMS computation completes, poll the RMS_DONE bit in the SYSTEM_STATUS register. The ALERT pin can also be used for requesting an interrupt by configuring the ALERT_RMS bit in the ALERT_MAP register.
6. For starting a new RMS measurement, write 1 to the RMS_EN bit in the GENERAL_CFG register.

8.3.13 Zero-Crossing-Detect Module

图 10 shows the zero-crossing-detection (ZCD) module that generates a digital output corresponding to the threshold crossings of an analog input. In order to detect threshold crossings on a particular analog input, configure the 4-bit channel ID in the ZCD_CHID register field. The threshold crossing to be detected can be configured in the HIGH_TH register. The output of the ZCD module can be mapped to any digital output by configuring the GPO_ZCD_UPDATE_EN, GPO_VALUE_ZCD_CFG_CH0_CH3, and GPO_VALUE_ZCD_CFG_CH4_CH7 registers.

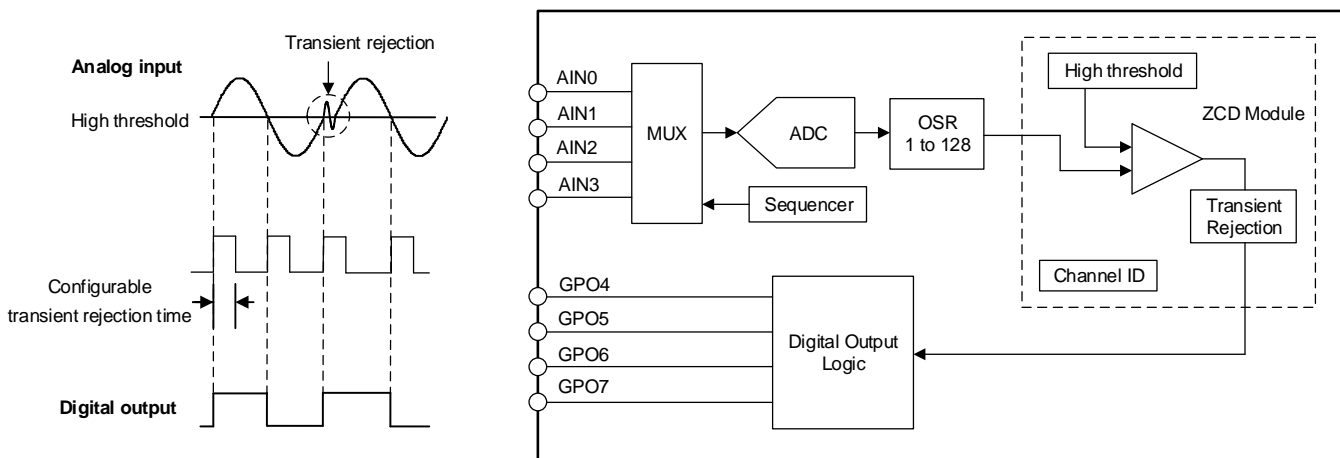

图 10. ZCD Module Operation Block Diagram

The ADC conversion result of the selected analog input channel is compared with the digital threshold and the digital output is set accordingly. 公式 5 shows how transients near zero crossings can be rejected by configuring the ZCD_BLANKING register.

$$\text{transient rejection time} = \text{MULT_EN} \times \text{ZCD_BLANKING}[6:0] \times \frac{1}{\text{sampling rate for ZCD channel}} \text{seconds} \quad (5)$$

8.3.14 Minimum, Maximum, and Latest Data Registers

The ADS7128 can record the minimum, maximum, and latest code (statistics registers) for every analog input channel. To enable or re-enable recording statistics, set the STATS_EN bit in the GENERAL_CFG register. Writing 1 to the STATS_EN bit reinitializes the statistics module, after which results from new conversions are recorded in the statistics registers. Until a new conversion result is available, previous values can be read from the statistics registers. Before reading the statistics registers, set STATS_EN to 0 to prevent any updates to this register block.

8.3.15 I²C Protocol Features

8.3.15.1 General Call

On receiving a general call (00h), the device provides an acknowledge (ACK).

8.3.15.2 General Call With Software Reset

On receiving a general call (00h) followed by a software reset (06h), the device resets itself.

8.3.15.3 General Call With a Software Write to the Programmable Part of the Slave Address

On receiving a general call (00h) followed by 04h, the device reevaluates its own I²C address configured by the ADDR pin. During this operation, the device does not respond to other I²C commands except the general-call command.

8.3.15.4 Configuring the Device for High-Speed I²C Mode

The device can be configured in high-speed I²C mode by providing an I²C frame with one of these codes: 0x09, 0x0B, 0x0D, or 0x0F.

After receiving one of these codes, the device sets the I2C_HIGH_SPEED bit in the SYSTEM_STATUS register and remains in high-speed I²C mode until a STOP condition is received in an I²C frame.

8.4 Device Functional Modes

表 7 lists the functional modes supported by the ADS7128.

表 7. Functional Modes

FUNCTIONAL MODE	CONVERSION CONTROL	MUX CONTROL	CONV_MODE[1:0]	SEQ_MODE[1:0]
Manual	9th falling edge of SCL (ACK)	Register write to MANUAL_CHID	00b	00b
Auto-sequence	9th falling edge of SCL (ACK)	Channel sequencer	00b	01b
Autonomous	Internal to the device	Channel sequencer	01b	01b

The device powers up in manual mode (see the [Manual Mode](#) section) and can be configured into any mode listed in 表 7 by writing the configuration registers for the desired mode.

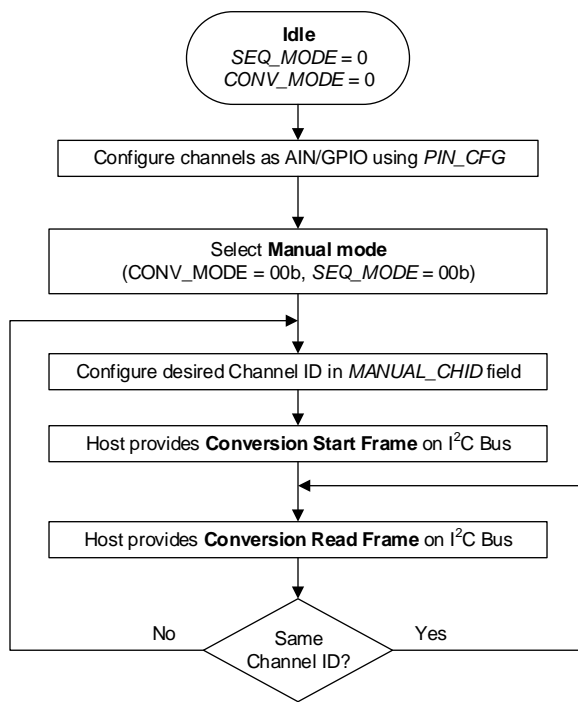

8.4.1 Device Power-Up and Reset

On power-up, the device calculates the address from the resistors connected on the ADDR pin and the BOR bit is set, thus indicating a power-cycle or reset event.

The device can be reset by an I²C general call (00h) followed by a software reset (06h), by setting the RST bit, or by recycling the power on the AVDD pin.

8.4.2 Manual Mode

Manual mode allows the external host processor to directly select the analog input channel. 图 11 lists the steps for operating the device in manual mode.

Manual mode with channel selection using register write

图 11. Device Operation in Manual Mode

Provide an I²C start or restart frame to initiate a conversion, as shown in the conversion start frame of 图 12, after configuring the device registers. ADC data can be read in subsequent I²C frames. The number of I²C frames required to read conversion data depends on the output data frame size; see the [Output Data Format](#) section for more details. A new conversion is initiated on the ninth falling edge of SCL (ACK bit) when the last byte of output data is read.

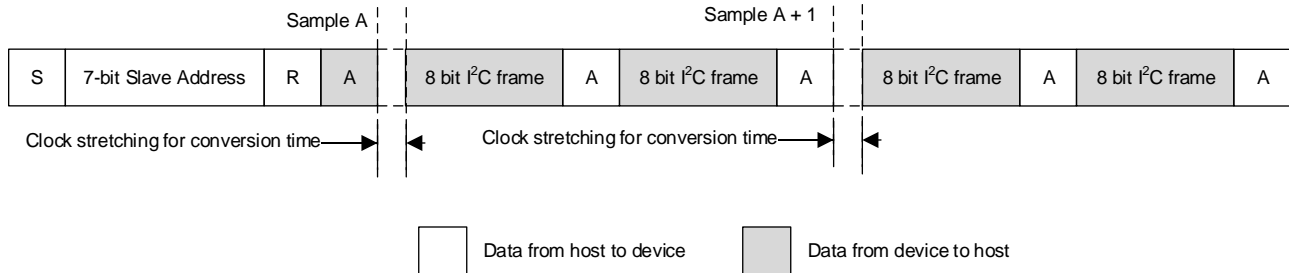

图 12. Starting a Conversion and Reading Data in Manual Mode

8.4.3 Auto-Sequence Mode

In auto-sequence mode, the internal channel sequencer switches the multiplexer to the next analog input channel after every conversion. The desired analog input channels can be configured for sequencing in the AUTO_SEQ_CHSEL register. To enable the channel sequencer, set SEQ_START to 1b. After every conversion, the channel sequencer switches the multiplexer to the next analog input in ascending order. To stop the channel sequencer from selecting channels, set SEQ_START to 0b. 图 13 lists the conversion start and read frames for auto-sequence mode.

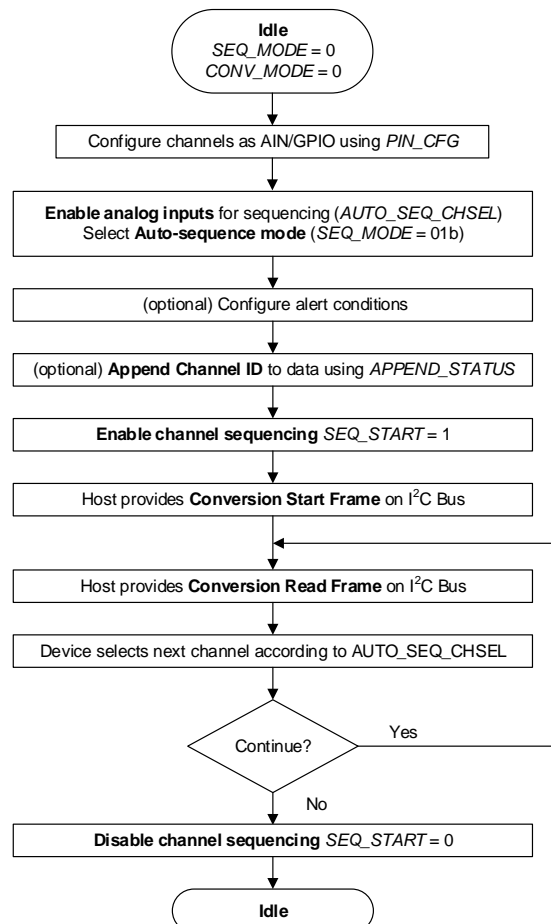

图 13. Device Operation in Auto-Sequence Mode

8.4.4 Autonomous Mode

In autonomous mode, the device can be programmed to monitor the voltage applied on the analog input pins of the device and generate a signal on the ALERT pin when the programmable high or low threshold values are crossed. In this mode, the device generates the start of conversion using the internal oscillator. The first start of conversion must be provided by the host and the device then generates the subsequent start of conversions.

图 14 shows the steps for configuring the operation mode to autonomous mode. Abort the ongoing sequence by setting SEQ_START to 0b before changing the functional mode or device configuration.

0011 0000b	Reading a continuous block of registers
0010 1000b	Writing a continuous block of registers

8.5.1 Reading Registers

The I²C master can either read a single register or a continuous block registers from the device, as described in the [Single Register Read](#) and [Reading a Continuous Block of Registers](#) sections.

8.5.1.1 Single Register Read

To read a single register from the device, the I²C master must provide an I²C command with three frames to set the register address for reading data. 表 9 lists the opcodes for different commands. After this command is provided, the I²C master must provide another I²C frame (as shown in 图 15) containing the device address and the read bit. After this frame, the device provides the register data. The device provides the same register data even if the host provides more clocks. To end the register read command, the master must provide a STOP or a RESTART condition in the I²C frame.

NOTE: S = start, Sr = repeated start, and P = stop.

图 15. Reading Register Data

8.5.1.2 Reading a Continuous Block of Registers

To read a continuous block of registers, the I²C master must provide an I²C command to set the register address. The register address is the address of the first register in the block that must be read. After this command is provided, the I²C master must provide another I²C frame, as shown in 图 16, containing the device address and the read bit. After this frame, the device provides the register data. The device provides data for the next register when more clocks are provided. When data are read from addresses that do not exist in the register map of the device, the device returns zeros. If the device does not have any further registers to provide data on, the device provide zeros. To end the register read command, the master must provide a STOP or a RESTART condition in the I²C frame.

NOTE: S = start, Sr = repeated start, and P = stop.

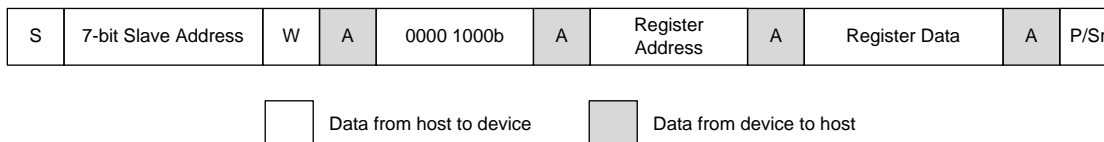

图 16. Reading a Continuous Block of Registers

8.5.2 Writing Registers

The I²C master can either write a single register or a continuous block of registers to the device, set a few bits in a register, or clear a few bits in a register.

8.5.2.1 Single Register Write

To write a single register from the device, as shown in 图 17, the I²C master must provide an I²C command with four frames. The register address is the address of the register that must be written and the register data is the value that must be written. 表 9 lists the opcodes for different commands. To end the register write command, the master must provide a STOP or a RESTART condition in the I²C frame.

NOTE: S = start, Sr = repeated start, and P = stop.

图 17. Writing a Single Register

8.5.2.2 Set Bit

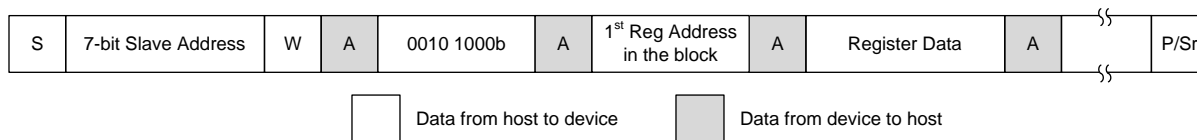

The I²C master must provide an I²C command with four frames, as shown in 图 17, to set bits in a register without changing the other bits. The register address is the address of the register that the bits must set and the register data is the value representing the bits that must be set. Bits with a value of 1 in the register data are set and bits with a value of 0 in the register data are not changed. 表 9 lists the opcodes for different commands. To end this command, the master must provide a STOP or RESTART condition in the I²C frame.

8.5.2.3 Clear Bit

The I²C master must provide an I²C command with four frames, as shown in 图 17, to clear bits in a register without changing the other bits. The register address is the address of the register that the bits must clear and the register data is the value representing the bits that must be cleared. Bits with a value of 1 in the register data are cleared and bits with a value of 0 in the register data are not changed. 表 9 lists the opcodes for different commands. To end this command, the master must provide a STOP or a RESTART condition in the I²C frame.

8.5.2.4 Writing a Continuous Block of Registers

The I²C master must provide an I²C command, as shown in 图 18, to write a continuous block of registers. The register address is the address of the first register in the block that must be written. The I²C master must provide data for registers in subsequent I²C frames in an ascending order of register addresses. Writing data to addresses that do not exist in the register map of the device have no effect. 表 9 lists the opcodes for different commands. If the data provided by the I²C master exceeds the address space of the device, the device ignores the data beyond the address space. To end the register write command, the master must provide a STOP or a RESTART condition in the I²C frame.

NOTE: S = start, Sr = repeated start, and P = stop.

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 11. ADS7128 Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

6	SEQ_STATUS	R	0b	Status of the channel sequencer. 0b = Sequence stopped 1b = Sequence in progress
5	I ² C_SPEED	R	0b	I ² C high-speed status. 0b = I ² C bus is not in high speed mode. 1b = I ² C bus is in high speed mode.
4	RMS_DONE	R/W	0b	RMS computation status. Clear this bit by writing 1b to this bit. 0b = RMS operation in progress or not started; RMS result not ready. 1b = RMS computation complete; RMS result ready.
3	OSR_DONE	R/W	0b	Averaging status. Clear this bit by writing 1b to this bit. 0b = Averaging in progress or not started; average result is not ready. 1b = Averaging complete; average result is ready.
2	CRC_ERR_FUSE	R	0b	Device power-up configuration CRC check status. To re-evaluate this bit, software reset the device or power cycle AVDD. 0b = No problems detected in power-up configuration. 1b = Device configuration not loaded correctly.
1	CRC_ERR_IN	R/W	0b	Status of CRC check on incoming data. Write 1b to clear this error flag. 0b = No CRC error. 1b = CRC error detected. All register writes, except to addresses 0x00 and 0x01, are blocked.
0	BOR	R/W	1b	Brown out reset indicator. This bit is set if brown out condition occurs or device is power cycled. Write 1b to this bit to clear the flag. 0b = No brown out since last time this bit was cleared. 1b = Brown out condition detected or device power cycled.

8.6.2 GENERAL_CFG Register (Address = 0x1) [reset = 0x0]

7	RMS_EN	R/W	0b	Enable or disable the RMS module. 0b = RMS module disabled. 1b = RMS module enabled; writing 1b to this bit clears RMS_RESULT registers and initiates new RMS computation.
6	CRC_EN	R/W	0b	Enable or disable the CRC on device interface. 0b = CRC module disabled. 1b = CRC appended to data output. CRC check is enabled on incoming data.
5	STATS_EN	R/W	0b	Enable or disable the statistics module to update minimum, maximum, and latest output code registers. 0b = Statistics registers are not updated. 1b = Clear statistics registers and continue updating with new conversion results.
4	DWC_EN	R/W	0b	Enable or disable the digital window comparator. 0b = Reset or disable the digital window comparator. 1b = Enable the digital window comparator.
3	CNVST	W	0b	Control start conversion on selected analog input. Readback of this bit returns 0b. 0b = Normal operation; conversions start on the 9th falling edge of I ² C frame. Device stretches SCL until end of conversion or completion of averaging. 1b = Initiate start of conversion. Device does not stretch SCL until end of conversion or completion of averaging.
2	CH_RST	R/W	0b	Force all channels to be analog inputs. 0b = Normal operation. 1b = All channels are configured as analog inputs irrespective of configuration in other registers.
1	CAL	R/W	0b	Calibrate ADC offset. 0b = Normal operation. 1b = ADC offset is calibrated. After calibration is complete, this bit is set to 0b.
0	RST	W	0b	Software reset all registers to default values. 0b = Normal operation. 1b = Device is reset. After reset is complete, this bit is set to 0b and BOR bit is set to 1b.

7	CONV_ON_ERR	R/W	0b	Control continuation of autonomous modes if CRC error is detected on communication interface. 0b = If CRC error is detected, device continues channel sequencing and pin configuration is retained. See the CRC_ERR_IN bit for more details. 1b = If CRC error is detected, device changes all channels to analog inputs and channel sequencing is paused until CRC_ERR_IN bit is set to 0b. After clearing CRC_ERR_IN flag, device resumes channel sequencing and pin configuration is restored.
6-5	CONV_MODE[1:0]	R/W	0b	These bits set the mode of conversion of the ADC. 0b = Manual mode; conversions are initiated by the host. 1b = Autonomous mode; conversions are initiated by the internal state machine.
4	OSC_SEL	R/W	0b	Selects the oscillator for internal timing generation. 0b = High-speed oscillator. 1b = Low-power oscillator.
3-0	CLK_DIV[3:0]	R/W	0b	Sampling speed control in autonomous monitoring mode (CONV_MODE = 01b). See the section on oscillator and timing control for details.

Bit	Field	Type	Reset	Description
7-0	EVENT_RGN[7:0]	R/W	0b	Choice of region used in monitoring analog/digital inputs CH[7:0]. 0b = Alert flag is set if: (conversion result < low threshold) or (conversion result > high threshold). For digital inputs, logic 1 sets the alert flag. 1b = Alert flag is set if: (low threshold > conversion result < high threshold). For digital inputs, logic 0 sets the alert flag.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The two primary circuits required to maximize the performance of a high-precision, successive approximation register (SAR), analog-to-digital converter (ADC) are the input driver and the reference driver circuits. This section details some general principles for designing the input driver circuit, reference driver circuit, and provides some application circuits designed for the ADS7128.

9.2 Typical Applications

9.2.1 Mixed-Channel Configuration

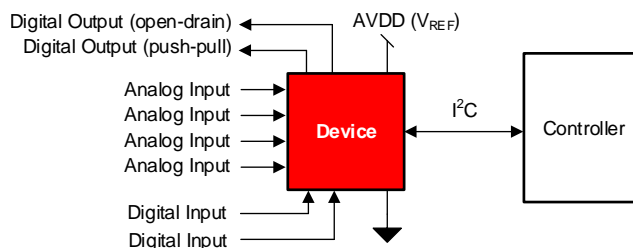

图 136. DAQ Circuit: Single-Supply DAQ

9.2.1.1 Design Requirements

The goal of this application is to configure some channels of the ADS7128 as digital inputs, open-drain digital outputs, and push-pull digital outputs.

9.2.1.2 Detailed Design Procedure

The ADS7128 can support GPIO functionality at each input pin. Any analog input pin can be independently configured as a digital input, a digital open-drain output, or a digital push-pull output through the PIN_CFG and GPIO_CFG registers; see 表 4.

9.2.1.2.1 Digital Input

The digital input functionality can be used to monitor a signal within the system. 图 137 illustrates that the state of the digital input can be read from the GPI_VALUE register.

Typical Applications (接下页)

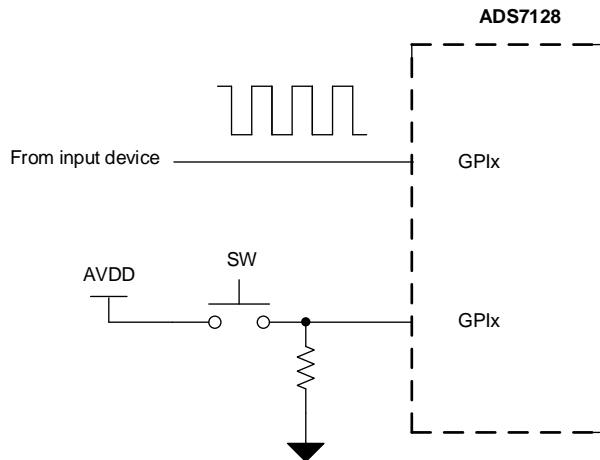

图 137. Digital Input

9.2.1.2.2 Digital Open-Drain Output

The channels of the ADS7128 can be configured as digital open-drain outputs supporting an output voltage up to 5.5 V. An open-drain output, as shown in 图 138, consists of an internal FET (Q) connected to ground. The output is idle when not driven by the device, which means Q is off and the pull-up resistor, R_{PULL_UP} , connects the GPOx node to the desired output voltage. The output voltage can range anywhere up to 5.5 V, depending on the external voltage that the GPIOx is pulled up to. When the device is driving the output, Q turns on, thus connecting the pull-up resistor to ground and bringing the node voltage at GPOx low.

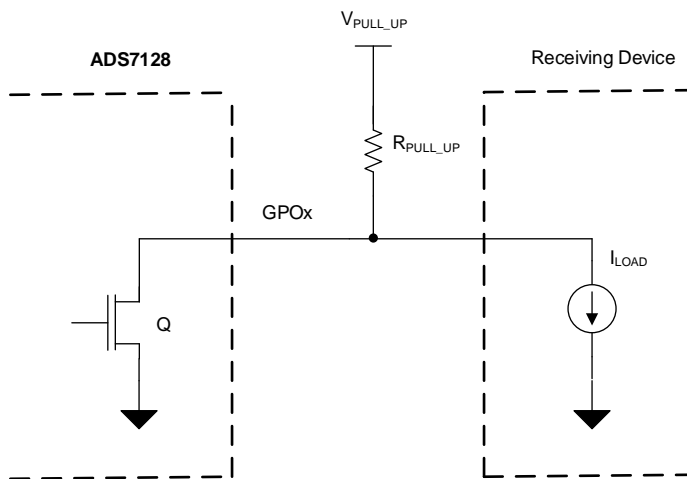

图 138. Digital Open-Drain Output

The minimum value of the pullup resistor, as calculated in 公式 6, is given by the ratio of V_{PULL_UP} and the maximum current supported by the device digital output (5 mA).

$$R_{MIN} = (V_{PULL_UP} / 5 \text{ mA}) \quad (6)$$

The maximum value of the pullup resistor, as calculated in 公式 7, depends on the minimum input current requirement, I_{LOAD} , of the receiving device driven by this GPIO.

$$R_{MAX} = (V_{PULL_UP} / I_{LOAD}) \quad (7)$$

Select R_{PULL_UP} such that $R_{MIN} < R_{PULL_UP} < R_{MAX}$.

Typical Applications (接下页)

9.2.1.3 Digital Push-Pull Output

The channels of the ADS7128 can be configured as digital push-pull outputs supporting an output voltage up to AVDD. As shown in 图 139, a push-pull output consists of two mirrored opposite bipolar transistors, Q1 and Q2. The device can both source and sink current because only one transistor is on at a time (either Q2 is on and pulls the output low, or Q1 is on and sets the output high). A push-pull configuration always drives the line opposed to an open-drain output where the line is left floating.

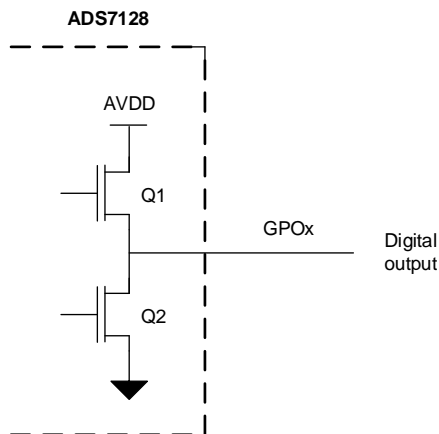

图 139. Digital Push-Pull Output

10 Power Supply Recommendations

10.1 AVDD and DVDD Supply Recommendations

The ADS7128 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. For supplies greater than 2.35 V, AVDD and DVDD can be shorted externally if single-supply operation is desired. The AVDD supply also defines the full-scale input range of the device. Decouple the AVDD and DVDD pins individually, as shown in 图 140, with 1-μF ceramic decoupling capacitors. The minimum capacitor value required for AVDD and DVDD is 200 nF and 20 nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220 nF is required for decoupling.

11 Layout

11.1 Layout Guidelines

图 141 shows a board layout example for the ADS7128. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the AVDD supply away from noise sources.

Use 1- μ F ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect the GND pin to the ground plane using short, low-impedance paths. The AVDD supply voltage also functions as the reference voltage for the ADS7128. Place the decoupling capacitor (C_{REF}) for AVDD close to the device AVDD and GND pins and connect C_{REF} to the device pins with thick copper tracks.

All other trademarks are the property of their respective owners.

12.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

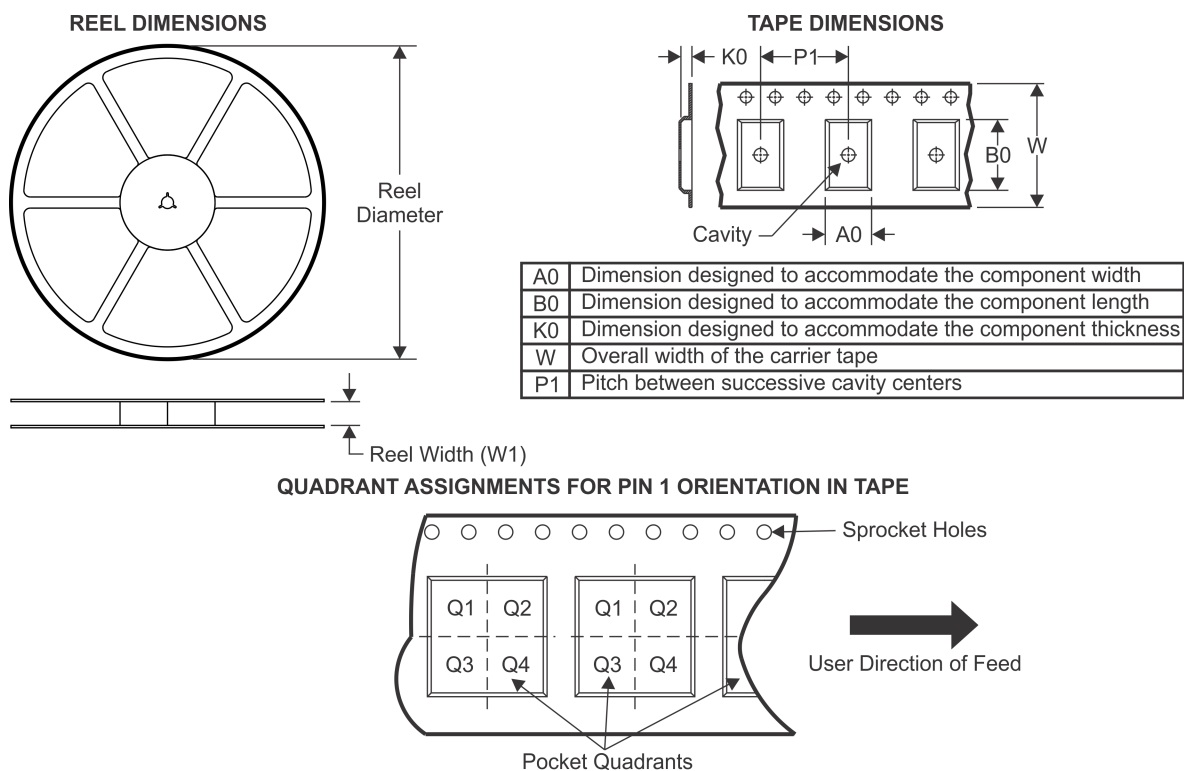

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
