

ADC32J2x 具有 JESD204B 接口的双通道、12 位、50MSPS 至 160MSPS 模数转换器

1 特性

- 双通道
- 12 位分辨率
- 1.8V 单电源
- 支持 1 分频，2 分频和 4 分频的灵活输入时钟缓冲器
- $f_{IN} = 70\text{MHz}$ 时，信噪比 (SNR) = 70.3dBFS，无杂散动态范围 (SFDR) = 88dBc
- 超低功耗：
 - 160MSPS 时为每通道 227mW
- 通道隔离：105dB
- 内部抖动
- JESD204B 串口：
 - 兼容子类 0、1、2，速率最高达 3.2Gbps
 - 支持每个 ADC 一条通道（高达 160MSPS）
- 支持多芯片同步
- 与 14 位版本器件 (ADC32J4X) 引脚到引脚兼容
- 封装：超薄四方扁平无引线 (VQFN)-48 (7mm x 7mm)

2 应用

- 多载波、多模式蜂窝基站
- 雷达和智能天线阵列
- 炮弹制导
- 电机控制反馈
- 网络和矢量分析器
- 通信测试设备
- 无损检测
- 微波接收器
- 软件定义无线电 (SDR)
- 正交和分集无线电接收器

3 说明

ADC32J2x 属于高线性度、超低功耗、双通道、12 位、50MSPS 至 160MSPS 模数转换器 (ADC) 系列。此类器件专门设计用于支持具有宽动态范围需求且要求苛刻的高输入频率信号。时钟输入分频器可给予系统时钟架构设计更高的灵活性，SYSREF 输入可实现整个系统同步。该器件支持 JESD204B 接口，从而减少接口线路的数量，实现高系统集成度。JESD204B 接口是串行接口，仅通过一个差分对即可串行输出每个 ADC 的数据。内部锁相环 (PLL) 会将传入的 ADC 采样时钟乘以 20，以获得串行输出各通道的 12 位数据时所使用的位时钟。该器件支持子类 1，接口速率高达 3.2Gbps。

器件信息⁽¹⁾

器件型号	封装	封装尺寸（标称值）
ADC32J2X	VQFN (48)	7.00mm x 7.00mm

(1) 要了解所有可用封装，请见数据表末尾的封装选项附录。

启用抖动功能时的快速傅立叶变换 (FFT)
($f_s = 160\text{MSPS}$, SNR = 70.3dBFS, $f_{IN} = 10\text{MHz}$, SFDR = 92.6dBc)

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AVDD	4, 5, 8, 9, 12, 17, 20, 25, 28, 29, 32, 39, 46	I	Analog 1.8-V power supply
CLKM	18	I	Negative differential clock input for the ADC
CLKP	19	I	Positive differential clock input for the ADC
DAM	48	O	Negative serial JESD204B output for channel A
DAP	47	O	Positive serial JESD204B output for channel A
DBM	45	O	Negative serial JESD204B output for channel B
DBP	44	O	Positive serial JESD204B output for channel B
DVDD	3,34	I	Digital 1.8-V power supply
GND	PowerPAD™	I	Ground, 0 V
INAM	11	I	Negative differential analog input for channel A
INAP	10	I	Positive differential analog input for channel A
INBM	26	I	Negative differential analog input for channel B
INBP	27	I	Positive differential analog input for channel B
NC	2, 6, 7, 30, 31, 35, 37, 38, 40, 41	—	Do not connect
OVRA	1	O	Overrange indicator for channel A
OVRB	36	O	Overrange indicator for channel B
PDN	33	I	Power-down control. This pin has an internal 150-kΩ pulldown resistor.
RESET	21	I	Hardware reset; active high. This pin has an internal 150-kΩ pulldown resistor.
SCLK	13	I	Serial interface clock input. This pin has an internal 150-kΩ pulldown resistor.
SDATA	14	I	Serial Interface data input. This pin has an internal 150-kΩ pulldown resistor.
SDOUT	16	O	Serial interface data output
SEN	15	I	Serial interface enable; active low. This pin has an internal 150-kΩ pullup resistor to AVDD.
SYNCP~	42	I	Positive JESD204B synch input
SYNCP~	43	I	Negative JESD204B synch input
SYSREFM	23	I	Negative external SYSREF input
SYSREFP	22	I	Positive external SYSREF input
VCM	24	O	Common-mode voltage output for analog inputs

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range, AVDD		−0.3	2.1	V
Supply voltage range, DVDD		−0.3	2.1	V
Voltage applied to input pins:	INAP, INBP	−0.3	AVDD + 0.3	V
	CLKP, CLKM	−0.3	AVDD + 0.3	V
	SYSREFP, SYSREFM, SYNCN~, SYNCM~	−0.3	AVDD + 0.3	V
	SCLK, SEN, SDATA, RESET, PDN	−0.3	AVDD + 0.3	V
Temperature range	Operating free-air, T _A	−40	85	°C
	Operating junction, T _J		125	°C
	Storage, T _{stg}	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
SUPPLIES						
AVDD	Analog supply voltage range		1.7	1.8	1.9	V
DVDD	Digital supply voltage range		1.7	1.8	1.9	V
ANALOG INPUT						
V _{ID}	Differential input voltage	For input frequencies < 450 MHz	2			V _{PP}
		For input frequencies < 600 MHz	1			V _{PP}
V _{IC}	Input common-mode voltage		VCM ± 0.025			V
CLOCK INPUT						
Input clock frequency		Sampling clock frequency	25	160 ⁽¹⁾		MSPS
Input clock amplitude (differential)		Sine wave, ac-coupled	1.5		V	
		LPECL, ac-coupled	1.6		V	
		LVDS, ac-coupled	0.7		V	
Input clock duty cycle			50%			
Input clock common-mode voltage			0.95		V	
DIGITAL OUTPUTS						
C _{LOAD}	Maximum external load capacitance from each output pin to GND		3.3		pF	
R _{LOAD}	Single-ended load resistance		100		Ω	

- (1) With the clock divider enabled by default for divide-by-1. Maximum sampling clock frequency for the divide-by-4 option is 640 MSPS.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADC32J2x	UNIT
		RGZ (VQFN)	
		48 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	25.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	18.9	°C/W
R _{θJB}	Junction-to-board thermal resistance	3.0	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	3	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.5	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics

Typical values are at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 85°C, Maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUT					
Differential input full-scale			2.0		V _{PP}
Input resistance	Differential at dc		6.5		kΩ
Input capacitance	Differential at dc		5.2		pF
VCM common-mode voltage output			0.95		V
VCM output current capability			10		mA
Input common-mode current	Per analog input pin		1.5		μA/MSPS
Analog input bandwidth (3 dB)	50-Ω differential source driving 50-Ω termination across INP and INM		450		MHz
DC ACCURACY					
Offset error		–20		20	mV
E _{G(REF)}	Gain error as a result of internal reference inaccuracy alone	–3		3	%FS
E _{G(CHAN)}	Gain error of channel alone		±1		%FS
	Temperature coefficient of E _{G(CHAN)}		–0.017		Δ%FS/°C
CHANNEL-TO-CHANNEL ISOLATION					
Crosstalk	f _{IN} = 10 MHz		105		dB
	f _{IN} = 100 MHz		105		dB
	f _{IN} = 200 MHz		105		dB
	f _{IN} = 230 MHz		105		dB
	f _{IN} = 300 MHz		105		dB

7.6 Electrical Characteristics: ADC32J22, ADC32J23

Typical values are at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, Maximum sampling rate, 50% clock duty cycle, $AVDD = DVDD = 1.8\text{ V}$, and -1-dBFS differential input, unless otherwise noted.

PARAMETER	ADC32J22			ADC32J23			UNIT
	MIN	TYP	MAX	MIN	TYP	MAX	
ADC clock frequency			50			80	MSPS
Resolution	12			12			Bits
1.8-V analog supply current		134	267		152	272	mA
1.8-V digital supply current		22	40		31	46	mA
Total power dissipation		281	435		329	450	mW
Global power-down dissipation		5			5		mW
Wake-up time from global power-down		85			85		μs
Standby power-down dissipation		99			105		mW
Wake-up time from standby power-down		35			35		μs

7.7 Electrical Characteristics: ADC32J24, ADC32J25

Typical values are at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, Maximum sampling rate, 50% clock duty cycle, $AVDD = DVDD = 1.8\text{ V}$, and -1-dBFS differential input, unless otherwise noted.

7.12 Digital Characteristics

The dc specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1. AVDD = DVDD = 1.8 V and –1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DIGITAL INPUTS (RESET, SCLK, SEN, SDATA, PDN) ⁽¹⁾						
V _{IH}	High-level input voltage	All digital inputs support 1.8-V and 3.3-V logic levels	1.2			V
V _{IL}	Low-level input voltage	All digital inputs support 1.8-V and 3.3-V logic levels			0.4	V
I _{IH}	High-level input current	SEN		0		μA
		RESET, SCLK, SDATA, PDN		10		μA
I _{IL}	Low-level input current	SEN		10		μA
		RESET, SCLK, SDATA, PDN		0		μA
DIGITAL INPUTS (SYNCP~, SYNCM~, SYSREFP, SYSREFM)						
V _{IH}	High-level input voltage			1.3		V
V _{IL}	Low-level input voltage			0.5		V
V _(CM_DIG)	Common-mode voltage for SYNC~ and SYSREF			0.9		V
DIGITAL OUTPUTS (SDOUT, OVRA, OVRB)						
V _{OH}	High-level output voltage		DVDD – 0.1	DVDD		V
V _{OL}	Low-level output voltage				0.1	V
DIGITAL OUTPUTS (JESD204B Interface: DxP, DxM) ⁽²⁾						
V _{OH}	High-level output voltage			AVDD		V
V _{OL}	Low-level output voltage			AVDD – 0.4		V
V _{OD}	Output differential voltage			0.4		V
V _{OC}	Output common-mode voltage			AVDD – 0.2		V
	Transmitter short-circuit current	Transmitter pins shorted to any voltage between –0.25 V and 1.45 V	–100		100	mA
Z _{os}	Single-ended output impedance			50		Ω
	Output capacitance	Output capacitance inside the device, from either output to ground		2		pF

- (1) The RESET, SCLK, SDATA, and PDN pins have a 150-kΩ (typical) internal pulldown resistor to ground and the SEN pin has a 150-kΩ (typical) pullup resistor to AVDD.
- (2) 50-Ω, single-ended external termination to 1.8 V.

7.13 Timing Requirements

Typical values are at 25°C, AVDD = DVDD = 1.8 V, and –1-dBFS differential input, unless otherwise noted. Minimum and maximum values are across the full temperature range: T_{MIN} = –40°C to T_{MAX} = 85°C. See [Figure 143](#).

	MIN	TYP	MAX	UNIT
SAMPLE TIMING CHARACTERISTICS				
Aperture delay	0.85	1.25	1.65	ns
Aperture delay matching between two channels on the same device		±70		ps
Aperture delay matching between two devices at the same temperature and supply voltage		±150		ps
Aperture jitter		200		f _s rms
Wake-up time to valid data after coming out of STANDBY mode		35	100	μs
Wake-up time to valid data after coming out of global power-down		85	300	μs
t _{SU_SYNC~} Setup time for SYNC~ referenced to input clock rising edge	1			ns
t _{H_SYNC~} Hold time for SYNC~ referenced to input clock rising edge	100			ps
t _{SU_SYSREF} Setup time for SYSREF referenced to input clock rising edge	1			ns
t _{H_SYSREF} Hold time for SYSREF referenced to input clock rising edge	100			ps
CML OUTPUT TIMING CHARACTERISTICS				
Unit interval	320		1667	ps
Serial output data rate			3.125	Gbps
Total jitter: 3.125 Gbps (20X mode, f _s = 156.25 MSPS)		0.3		p-pUI
t _R , t _F Data rise time, data fall time: rise and fall times measured from 20% to 80%, differential output waveform, 600 Mbps ≤ bit rate ≤ 3.125 Gbps		105		ps

Table 1. Latency in Different Modes⁽¹⁾⁽²⁾

MODE	PARAMETER	LATENCY (N Cycles)	TYPICAL DATA DELAY (t _D , ns)
20X	ADC latency	17	0.29 × t _S + 3
	Normal OVR latency	9	0.5 × t _S + 2
	Fast OVR latency	7	0.5 × t _S + 2
	From SYNC~ falling edge to CGS phase ⁽³⁾	15	0.3 × t _S + 4
	From SYNC~ rising edge to ILA sequence ⁽⁴⁾	17	0.3 × t _S + 4
40X	ADC latency	16	0.85 × t _S + 3.9
	Normal OVR latency	9	0.5 × t _S + 2
	Fast OVR latency	7	0.5 × t _S + 2
	From SYNC~ falling edge to CGS phase ⁽³⁾	14	0.9 × t _S + 4
	From SYNC~ rising edge to ILA sequence ⁽⁴⁾	12	0.9 × t _S + 4

(1) Overall latency = latency + t_D.

(2) t_S is the time period of the ADC conversion clock.

(3) Latency is specified for subclass 2. In subclass 0, the SYNC~ falling edge to CGS phase latency is 16 clock cycles in 10X mode and 15 clock cycles in 20X mode.

(4) Latency is specified for subclass 2. In subclass 0, the SYNC~ rising edge to ILA sequence latency is 11 clock cycles in 10X mode and 11 clock cycles in 20X mode.

7.14 Typical Characteristics: ADC32J25

Typical values are at $T_A = 25^\circ\text{C}$, ADC sampling rate = 160 MSPS, 50% clock duty cycle, $AVDD = DVDD = 1.8\text{ V}$, -1-dBFS differential input, $2\text{-}V_{PP}$ full-scale, 32k-point FFT, dither enabled, and special modes written, unless otherwise noted.

9 Detailed Description

9.1 Overview

The ADC32J2x are a high-linearity, ultra-low power, dual-channel, 12-bit, 50-MSPS to 160-MSPS, analog-to-digital converter (ADC) family. The devices are designed specifically to support demanding, high input frequency signals with large dynamic range requirements. A clock input divider allows more flexibility for system clock architecture design and the SYSREF input enables complete system synchronization. The devices support a JESD204B interface in order to reduce the number of interface lines, thus allowing for high system integration density. The JESD204B interface is a serial interface, where the data of each ADC are serialized and output over only one differential pair. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock by 20 to derive the bit clock that is used to serialize the 12-bit data from each channel. The devices support subclass 0, 1, 2 with interface data rates up to 3.2 Gbps.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Analog Inputs

The ADC32J2x analog signal inputs are designed to be driven differentially. Each input pin (INP, INM) must swing symmetrically between ($V_{CM} + 0.5\text{ V}$) and ($V_{CM} - 0.5\text{ V}$), resulting in a $2\text{-}V_{PP}$ (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 450 MHz (50- Ω source driving 50- Ω termination between INP and INM).

Feature Description (continued)

9.3.2 Clock Input

The device clock inputs can be driven differentially (sine, LVPECL, or LVDS) or single-ended (LVCMOS), with little or no difference in performance between them. The common-mode voltage of the clock inputs is set to 1.4 V using internal 5-k Ω resistors. The self-bias clock inputs of the ADC32J2x can be driven by the transformer-coupled, sine-wave clock source or by the ac-coupled, LVPECL and LVDS clock sources, as shown in Figure 148, Figure 149, and Figure 150. See Figure 151 for details regarding the internal clock buffer.

NOTE: R_T = termination resistor, if necessary.

Figure 148. Differential Sine-Wave Clock Driving Circuit

Figure 149. LVDS Clock Driving Circuit

Figure 150. LVPECL Clock Driving Circuit

NOTE: C_{EQ} is 1 pF to 3 pF and is the equivalent input capacitance of the clock buffer.

Figure 151. Internal Clock Buffer

A single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM connected to ground with a 0.1-μF capacitor, as shown in [Figure 152](#). However, for best performance the clock inputs must be driven differentially, thereby reducing susceptibility to common-mode noise. For high input frequency sampling, a clock source with very low jitter is recommended. Band-pass filtering of the clock source can help reduce the effects of jitter. There is no change in performance with a non-50% duty cycle clock input.

Figure 152. Single-Ended Clock Driving Circuit

9.3.2.1 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors: quantization noise, thermal noise, and jitter noise, as shown in [Equation 1](#). Quantization noise is typically not noticeable in pipeline converters and is 74 dB for a 12-bit ADC. Thermal noise limits SNR at low input frequencies and clock jitter sets SNR for higher input frequencies.

$$SNR_{ADC}[dBc] = -20 \cdot \log \sqrt{\left(10^{\frac{SNR_{Quantization\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Thermal\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Jitter}}{20}}\right)^2} \quad (1)$$

The SNR limitation resulting from sample clock jitter can be calculated with [Equation 2](#):

$$SNR_{Jitter}[dBc] = -20 \cdot \log(2\pi \cdot f_{in} \cdot T_{Jitter}) \quad (2)$$

The total clock jitter (T_{Jitter}) has two components: the internal aperture jitter (200 fs for the device) that is set by the noise of the clock input buffer and the external clock. T_{Jitter} can be calculated with [Equation 3](#):

$$T_{Jitter} = \sqrt{(T_{Jitter,Ext.Clock_Input})^2 + (T_{Aperture_ADC})^2} \quad (3)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input and a faster clock slew rate improves the ADC aperture jitter. The devices have a thermal noise of 73.5 dBFS and internal aperture jitter of 200 fs. The SNR, depending on the amount of external jitter for different input frequencies, is shown in [Figure 153](#).

Figure 153. SNR vs Frequency and Jitter

9.3.2.2 Input Clock Divider

The devices are equipped with an internal divider on the clock input. The divider allows operation with a faster input clock, thus simplifying the system clock distribution design. The clock divider can be bypassed (divide-by-1) for operation with a 160-MHz clock, the divide-by-2 option supports a maximum input clock of 320 MHz, and the divide-by-4 option supports a maximum input clock frequency of 640 MHz.

9.3.3 Power-Down Control

The power-down functions of the ADC32J2x can be controlled either through the parallel control pin (PDN) or through an SPI register setting (see [register 15h](#)). The PDN pin can also be configured via SPI to a global power-down or standby functionality.

Table 2. Power-Down Modes

FUNCTION	POWER CONSUMPTION (mW)	WAKE-UP TIME (μs)
Global power-down	5	85
Standby	118	35

9.3.4 Internal Dither Algorithm

The ADC32J2x uses an internal dither algorithm to achieve high SFDR and a clean spectrum. However, the dither algorithm marginally degrades SNR, creating a trade-off between SNR and SFDR. If desired, the dither algorithm can be turned off by using the DIS DITH CHx registers bits. [Figure 154](#) and [Figure 155](#) show the effect of using dither algorithms.

9.3.5 JESD204B Interface

The ADC32J2x support device subclass 0, 1, and 2 with a maximum output data rate of 3.2 Gbps for each serial transmitter, as shown in Figure 156. The data of each ADC are serialized by 20X using an internal PLL and then transmitted out on one differential pair each. An external SYSREF (subclass 1) or SYNC (subclass 2) signal is used to align all internal clock phases and the local multiframe clock to a specific sampling clock edge. This process allows synchronization of multiple devices in a system and minimizes timing and alignment uncertainty.

Figure 156. JESD204B Interface

The JESD204B transmitter block consists of the transport layer, the data scrambler, and the link layer, as shown in Figure 157. The transport layer maps the ADC output data into the selected JESD204B frame data format and determines if the ADC output data or test patterns are transmitted. The link layer performs the 8b or 10b data encoding and the synchronization and initial lane alignment using the SYNC input signal. Optionally, data from the transport layer can be scrambled.

Figure 157. JESD204B Block

9.3.5.1 JESD204B Initial Lane Alignment (ILA)

The initial lane alignment process is started by the receiving device by asserting the SYNC signal. When a logic high is detected on the SYNC input pins, the ADC32J2x starts transmitting comma (K28.5) characters to establish code group synchronization. When synchronization is complete, the receiving device de-asserts the SYNC signal and the ADC32J2x starts the initial lane alignment sequence with the next local multiframe clock boundary. The ADC32J2x transmits four multiframes, each containing K frames (K is SPI programmable). Each multiframe contains the frame start and end symbols; the second multiframe also contains the JESD204 link configuration data.

9.3.5.2 JESD204B Test Patterns

There are three different test patterns available in the transport layer of the JESD204B interface. The ADC32J2x supports a clock output, an encoded, and a PRBS ($2^{15} - 1$) pattern. These patterns can be enabled via SPI register writes and are located in address 26h (bits 7:6).

9.3.5.3 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- L is the number of lanes per link,
- M is the number of converters per device,
- F is the number of octets per frame clock period, and
- S is the number of samples per frame.

Table 3 lists the available JESD204B format and valid range for the ADC32J2x. The ranges are limited by the SERDES line rate and the maximum ADC sample frequency.

Table 3. LMFS Values and Interface Rate

L	M	F	S	MINIMUM ADC SAMPLING RATE (MSPS)	MAXIMUM f_{SERDES} (Mbps)	MAXIMUM ADC SAMPLING RATE (MSPS)	MAXIMUM f_{SERDES} (GSPS)	MODE
2	2	2	1	15	300	160	3.2	20X (default)
1	2	4	1	10	400	80	3.2	40X

The detailed frame assembly for quad-channel mode is shown in Figure 158. The frame assembly configuration can be changed from 20X (default) to 40X by setting the registers listed in Table 4.

Figure 158. JESD Frame Assembly

Table 4. Configuring 40X Mode

ADDRESS	DATA
2Bh	01h
30h	11h

9.3.5.4 Digital Outputs

The ADC32J2x JESD204B transmitter uses differential CML output drivers. The CML output current is programmable from 5 mA to 20 mA using SPI register settings. The output driver expects to drive a differential 100-Ω load impedance and place the termination resistors as close to the receiver inputs as possible to avoid unwanted reflections and signal distortion. Because the JESD204B employs 8b, 10b encoding, the output data stream is dc-balanced and ac-coupling can be used to avoid the need to match up common-mode voltages between the transmitter and receivers. Connect the termination resistors to the termination voltage, as shown in Figure 159.

Figure 159. CML Output Connections

Figure 160 shows the data eye measurements of the device JESD204B transmitter against the JESD204B transmitter mask at 3.125 Gbps (156.25 MSPS, 20X mode), respectively.

9.4 Device Functional Modes

9.4.1 Digital Gain

The input full-scale amplitude can be selected between 1 V_{PP} to 2 V_{PP} (default is 2 V_{PP}) by choosing the appropriate digital gain setting via an SPI register write. Digital gain provides an option to trade-off SNR for SFDR performance. A larger input full-scale increases SNR performance (2 V_{PP} is recommended for maximum SNR) whereas reduced input swing typically results in better SFDR performance. [Table 5](#) lists the available digital gain settings.

Table 5. Digital Gain vs Full-Scale Amplitude

DIGITAL GAIN (dB)	MAX INPUT VOLTAGE (V_{PP})
0	2.0
0.5	1.89
1	1.78
1.5	1.68
2	1.59
2.5	1.50
3	1.42
3.5	1.34
4	1.26
4.5	1.19
5	1.12
5.5	1.06
6	1.00

9.4.2 Overrange Indication

The ADC32J2x provides two different overrange indications. The normal OVR (default) is triggered if the final 12-bit data output exceeds the maximum code value. The fast OVR is triggered if the input voltage exceeds the programmable overrange threshold and is presented after just nine clock cycles, thus enabling a quicker reaction to an overrange event. By default, the normal overrange indication is output on the OVRx pins (where x is A, B, C, or D). The fast OVR indication can be presented on the overrange pins instead by using the SPI register map.

9.5 Programming

The ADC32J2x can be configured using a serial programming interface, as described in this section.

9.5.1 Serial Interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDATA (serial interface data), and SDOUT (serial interface data output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data SDATA are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 20 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

9.5.1.1 Register Initialization

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin (of durations greater than 10 ns); see [Figure 161](#). If required, the serial interface registers can be cleared during operation either:

1. Through a hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

9.5.1.1.1 Serial Register Write

The device internal register can be programmed with these steps:

1. Drive the SEN pin low,
2. Set the R/W bit to 0 (bit A15 of the 16-bit address),
3. Set bit A14 in the address field to 1,
4. Initiate a serial interface cycle by specifying the address of the register (A13 to A0) whose content must be written, and
5. Write the 8-bit data that are latched in on the SCLK rising edge.

Programming (continued)

Figure 161 and Table 6 show the timing requirements for the serial register write operation.

Figure 161. Serial Register Write Timing Diagram

Table 6. Serial Interface Timing⁽¹⁾

		MIN	TYP	MAX	UNIT
f_{SCLK}	SCLK frequency (equal to $1 / t_{SCLK}$)	> dc		20	MHz
t_{LOADS}	SEN to SCLK setup time	25			ns
t_{LOADH}	SCLK to SEN hold time	25			ns
t_{DSU}	SDIO setup time	25			ns
t_{DH}	SDIO hold time	25			ns

(1) Typical values are at 25°C, full temperature range is from $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$, and $AVDD = DVDD = 1.8\text{ V}$, unless otherwise noted.

9.5.1.1.2 Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDOUT pin. This readback mode may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. Given below is the procedure to read contents of serial registers:

1. Drive the SEN pin low.
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers.
3. Set bit A14 in the address field to 1.
4. Initiate a serial interface cycle specifying the address of the register (A13 to A0) whose content must be read.
5. The device outputs the contents (D7 to D0) of the selected register on the SDOUT pin.
6. The external controller can latch the contents at the SCLK rising edge.
7. To enable register writes, reset the R/W register bit to 0.

When READOUT is disabled, the SDOUT pin is in a high-impedance mode. If serial readout is not used, the SDOUT pin must float. [Figure 162](#) shows a timing diagram of the serial register read operation. Data appear on the SDOUT pin at the SCLK falling edge with an approximate delay (t_{SD_DELAY}) of 20 ns, as shown in [Figure 163](#).

Figure 162. Serial Register Read Timing Diagram

Figure 163. SDOUT Timing Diagram

9.5.2 Register Initialization

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 164 and Table 7.

Figure 164. Initialization of Serial Registers after Power-Up

Table 7. Power-Up Timing

		MIN	TYP	MAX	UNIT
t ₁	Power-on delay from power up to active high RESET pulse	1			ms
t ₂	Reset pulse duration: active high RESET pulse duration	10		1000	ns
t ₃	Register write delay from RESET disable to SEN active	100			ns

If required, the serial interface registers can be cleared during operation either:

1. Through hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

9.5.3 Start-Up Sequence

After power-up, the sequence described in Table 8 can be used to set up the ADC32J2x for basic operation.

Table 8. Start-Up Settings

STEP	DESCRIPTION	REGISTER ADDRESS AND DATA
1	Supply all supply voltages. There is no required power supply sequence for AVDD and DVDD	—
2	Pulse hardware reset (low to high to low) on pin 24	—
3	Optional configure LMFS of JESD204B interface to LMFS = 1241 (default is LMFS = 2221)	Address 2Bh, data 01h Address 30h, data 11h
4	Pulse SYNCb from low to high to transmit data from k28.5 sync mode	—

534	0	0	DIS DITH CHB	0	DIS DITH CHB	0	0	0

9.6.1 Summary of Special Mode Registers

Table 10 lists the location, value, and functions of special mode registers in the device.

Table 10. Special Modes Summary

	MODE	LOCATION	VALUE AND FUNCTION
Dither mode	DIS DITH CHA	01h (bits 5-4), 434h (bits 5, 3)	Creates a noise floor cleaner and improves SFDR; see the Internal Dither Algorithm section. 0000 = Dither disabled 1111 = Dither enabled
	DIS DITH CHB	01h (bits 3-2), 534h (bits 5, 3)	
Special mode 1	SPECIAL MODE 1 CHA	07h (bits 4-2)	Use for improved HD3. 000 = Default after reset 010 = Use for frequency < 120 MHz 111 = Use for frequency > 120 MHz
	SPECIAL MODE 1 CHB	08h (bits 4-2)	
Special mode 2	SPECIAL MODE 2 CHA	422h (bits 1-0)	Helps improve HD2. 00 = Default after reset 11 = Improves HD2
	SPECIAL MODE 2 CHB	522h (bits 1-0)	

9.6.2 Serial Register Descriptions

9.6.2.1 Register 01h (address = 01h)

Figure 165. Register 01h

7	6	5	4	3	2	1	0
0	0	DIS DITHER CHA		DIS DITHER CHB		0	0
W-0h	W-0h	R/W-0h		R/W-0h		W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 11. Register 01h Field Descriptions

Bit	Field	Type	Reset	Description
7-6	0	W	0h	Must write 0
5-4	DIS DITHER CHA	R/W	0h	These bits enable or disables the on-chip dither. Control these bits with bits 5 and 3 of register 434h. 00 = Dither enabled 11 = Dither disabled. Improves SNR by 0.2 dB for input frequencies up to 170 MHz.
3-2	DIS DITHER CHB	R/W	0h	These bits enable or disables the on-chip dither. Control these bits with bits 5 and 3 of register 534h. 00 = Dither enabled 11 = Dither disabled. Improves SNR by 0.2 dB for input frequencies up to 170 MHz.
1-0	0	W	0h	Must write 0

9.6.2.2 Register 03h (address = 03h)

Figure 166. Register 03h

7	6	5	4	3	2	1	0
0	0	0	0	0	0	CHA GAINEN	0
W-0h	W-0h	W-0h	W-0h	W-0h	W-0h	R/W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 12. Register 03h Field Descriptions

Bit	Field	Type	Reset	Description
7-2	0	W	0h	Must write 0
1	CHA GAINEN	R/W	0h	Digital gain enable bit for channel A. 0 = Digital gain disabled 1 = Digital gain enabled
0	0	W	0h	Must write 0

9.6.2.3 Register 04h (address = 04h)

Figure 167. Register 04h

SERDES TEST PATTERN	IDLE SYNC	TRP LAYER TESTMODE EN	FLIP ADC DATA	LANE ALIGN	FRAME ALIGN	TX LINK CONFIG DATA DIS	
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; -n = value after reset

Table 28. Register 2Ah Field Descriptions

Bit	Field	Type	Reset	Description
7-6	SERDES TEST PATTERN	R/W	0h	00 = Normal operation 01 = Outputs clock pattern: output is 10101010 pattern 10 = Encoded pattern: output is 1111111100000000 11 = PRBS sequence: output is $2^{15} - 1$
5	IDLE SYNC	R/W	0h	This bit sets the output pattern when SYNC is high. 0 = Sync code is k28.5 (BCBCh) 1 = Sync code is BC50h
4	TRP LAYER TESTMODE EN	R/W	0h	This bit generates the long transport layer test pattern mode according to 5.1.6.3 clause of the JESD204B specification. 0 = Test mode disabled 1 = Test mode enabled
3	FLIP ADC DATA	R/W	0h	0 = Normal operation 1 = Output data order is reversed: MSB – LSB
2	LANE ALIGN	R/W	0h	This bit inserts a lane alignment character (K28.3) for the receiver to align to the lane boundary per section 5.3.3.5 of the JESD204B specification. 0 = Normal operation 1 = Inserts lane alignment characters
1	FRAME ALIGN	R/W	0h	This bit inserts a frame alignment character (K28.7) for the receiver to align to the lane boundary per section 5.3.3.4 of the JESD204B specification. 0 = Normal operation 1 = Inserts frame alignment characters
0	TX LINK CONFIG DATA DIS	R/W	0h	This bit disables sending the initial link alignment (ILA) sequence when SYNC is de-asserted. 0 = Normal operation 1 = ILA disabled

9.6.2.18 Register 2Bh (address = 2Bh)

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 34. Register 3Ah Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC REQ	R/W	0h	This bit generates a synchronization request only when the SYNC REQ EN register bit is set. 0 = Normal operation 1 = Generates sync request
6	SYNC REQ EN	R/W	0h	0 = Sync request is made with the SYNCNCP~, SYNCNM~ pins 1 = Sync request is made with the SYNC REQ register bit
5-4	0	W	0h	Must write 0
3-0	OUTPUT CURRENT SEL	R/W	0h	JESD output buffer current selection. 0000 = 16 mA 0001 = 15 mA 0010 = 14 mA 0011 = 13 mA 0100 = 20 mA 0101 = 19 mA 0110 = 18 mA 0111 = 17 mA 1000 = 8 mA 1001 = 7 mA 1010 = 6 mA 1011 = 5 mA 1100 = 12 mA 1101 = 11 mA 1110 = 10 mA 1111 = 9 mA

9.6.2.24 Register 3Bh (address = 3Bh)

Figure 188. Register 3Bh

7	6	5	4	3	2	1	0
LINK LAYER TESTMODE			LINK LAYER RPAT	0	PULSE DET MODES		
R/W-0h			R/W-0h	W-0h	R/W-0h		

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 35. Register 3Bh Field Descriptions

Bit	Field	Type	Reset	Description
7-5	LINK LAYER TESTMODE	R/W	0h	These bits generate a pattern according to clause 5.3.3.8.2 of the JESD204B document. 000 = Normal ADC data 001 = D21.5 (high-frequency jitter pattern) 010 = K28.5 (mixed frequency jitter pattern) 011 = Repeat initial lane alignment (generates K28.5 character and repeat lane alignment sequences continuously) 100 = 12 octet RPAT jitter pattern
4	LINK LAYER RPAT	R/W	0h	This bit changes the running disparity in the modified RPAT pattern test mode (only when link layer test mode = 100). 0 = Normal operation 1 = Changes disparity
3	0	W	0h	Must write 0
2-0	PULSE DET MODES	R/W	0h	These bits select different detection modes for SYSREF (subclass 1) and SYNC (subclass2). For register settings see Table 36 .

Table 36. PULSE DET MODES Register Settings

D2	D1	D0	FUNCTIONALITY
0	Don't care	0	Allow all pulses to reset input clock dividers
1	Don't care	0	Do not allow reset of analog clock dividers
Don't care	0 to 1 transition	1	Allow one pulse immediately after the 0 to1 transition to reset the divider

9.6.2.25 Register 3Ch (address = 3Ch)
Figure 189. Register 3Ch

7	6	5	4	3	2	1	0
FORCE LMFC COUNT	LMFC COUNT INIT					RELEASE ILAN SEQ	
R/W-0h	R/W-0h					R/W-0h	

LEGEND: R/W = Read/Write; -n = value after reset

Table 37. Register 3Ch Field Descriptions

Bit	Field	Type	Reset	Description
7	FORCE LMFC COUNT	R/W	0h	0 = Normal operation 1 = Enables using different starting value for LMFC counter
6-2	LMFC COUNT INIT	R/W	0h	If SYSREF is transmitted to the digital block, the LMFC count resets to 0 and K28.5 stops transmitting when the LMFC count reaches 31. The initial value that the LMFC count resets to can be set using LMFC COUNT INIT. In this manner, the Rx can be synchronized early because the Rx receives the LANE ALIGNMENT SEQUENCE early. The FORCE LMFC COUNT register bit must be enabled.
1-0	RELEASE ILAN SEQ	R/W	0h	These bits delay the lane alignment sequence generation by 0, 1, 2, or 3 multiframes after the code group synchronization. 00 = 0 01 = 1 10 = 2 11 = 3

9.6.2.26 Register 422h (address = 422h)

10 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

Typical applications involving transformer-coupled circuits are discussed in this section. Transformers (such as ADT1-1WT or WBC1-1) can be used up to 250 MHz to achieve good phase and amplitude balances at ADC inputs. When designing the dc driving circuits, the ADC input impedance must be considered. [Figure 194](#) and [Figure 195](#) show the impedance ($Z_{in} = R_{in} || C_{in}$) across the ADC input pins.

Figure 194. Differential Input Resistance, R_{in}

Figure 195. Differential Input Capacitance, C_{in}

10.2 Typical Applications

10.2.1 Driving Circuit Design: Low Input Frequencies

Figure 196. Driving Circuit for Low Input Frequencies

10.2.1.1 Design Requirements

For optimum performance, the analog inputs must be driven differentially. An optional 5-Ω to 15-Ω resistor in series with each input pin can be kept to damp out ringing caused by package parasitics. The drive circuit may have to be designed to minimize the impact of kick-back noise generated by sampling switches opening and closing inside the ADC, as well as ensuring low insertion loss over the desired frequency range and matched impedance to the source.

10.2.1.2 Detailed Design Procedure

A typical application using two back-to-back coupled transformers is illustrated in Figure 196. The circuit is optimized for low input frequencies. An external R-C-R filter using 50-Ω resistors and a 22-pF capacitor is used. With the series inductor (39 nH), this combination helps absorb the sampling glitches.

10.2.1.3 Application Curve

Figure 197 shows the performance obtained by using the circuit shown in Figure 196.

$f_s = 160$ MSPS, SNR = 70.3 dBFS, $f_{IN} = 10$ MHz, SFDR = 92.6 dBc

Figure 197. FFT for 10-MHz Input Signal (Dither On)

Typical Applications (continued)

10.2.2 Driving Circuit Design: Input Frequencies Between 100 MHz to 230 MHz

Figure 198. Driving Circuit for Mid-Range Input Frequencies ($100 \text{ MHz} < f_{\text{IN}} < 230 \text{ MHz}$)

10.2.2.1 Design Requirements

See the [Design Requirements](#) section for further details.

10.2.2.2 Detailed Design Procedure

When input frequencies are between 100 MHz to 230 MHz, an R-LC-R circuit can be used to optimize performance, as shown in [Figure 198](#).

10.2.2.3 Application Curve

[Figure 199](#) shows the performance obtained by using the circuit shown in [Figure 198](#).

$f_s = 160 \text{ MSPS}$, $\text{SNR} = 69.1 \text{ dBFS}$, $f_{\text{IN}} = 170 \text{ MHz}$,
 $\text{SFDR} = 93.5 \text{ dBc}$

Figure 199. FFT for 170-MHz Input Signal (Dither On)

Typical Applications (continued)

10.2.3 Driving Circuit Design: Input Frequencies Greater than 230 MHz

Figure 200. Driving Circuit for High Input Frequencies ($f_{IN} > 230$ MHz)

10.2.3.1 Design Requirements

See the [Design Requirements](#) section for further details.

10.2.3.2 Detailed Design Procedure

For high input frequencies (> 230 MHz), using the R-C-R or R-LC-R circuit does not show significant improvement in performance. However, a series resistance of $10\ \Omega$ can be used as shown in [Figure 200](#).

10.2.3.3 Application Curve

[Figure 201](#) shows the performance obtained by using the circuit shown in [Figure 200](#).

$f_S = 160$ MSPS, SNR = 62.9 dBFS, $f_{IN} = 450$ MHz,
SFDR = 66 dBc

Figure 201. FFT for 450-MHz Input Signal (Dither On)

11 Power Supply Recommendations

The device requires a 1.8-V nominal supply for AVDD and DVDD. There are no specific sequence power-supply requirements during device power-up. AVDD and DVDD can power up in any order.

12 Layout

12.1 Layout Guidelines

The ADC32J2x EVM layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 202](#). Some important points to remember when laying out the board are:

1. Analog inputs are located on opposite sides of the device pin out to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pin out in opposite directions, as shown in the reference layout of [Figure 202](#) as much as possible.
2. In the device pin out, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 202](#) as much as possible.
3. Keep digital outputs away from the analog inputs. When these digital outputs exit the pin out, the digital output traces must not be kept parallel to the analog input traces because this configuration may result in coupling from digital outputs to analog inputs and degrade performance. All digital output traces to the receiver [such as a field-programmable gate array (FPGA) or an application-specific integrated circuit (ASIC)] must be matched in length to avoid skew among outputs.
4. At each power-supply pin (AVDD and DVDD), keep a 0.1- μ F decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- μ F, 1- μ F, and 0.1- μ F capacitors can be kept close to the supply source.

12.2 Layout Example

Figure 202. Typical Layout of the ADC32J2x Board

This glossary lists and explains terms, acronyms, and definitions.

14 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。 这些信息是针对指定器件可提供的最新数据。 这些数据会在无通知且不对本文档进行修订的情况下发生改变。 欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为 有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予 的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务 的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它 知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况 下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件 或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独力负责满足与其产品及其应用中使用的 TI 产品 相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见 故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因 在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特 有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使 用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同 意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独 力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
